> The trees, with very few exceptions, were what is called the "burr oak," a small variety of a very extensive genus; and the spaces between them, always irregular, and often of singular beauty, have obtained the name of "*openings*"; the two terms combined giving their appellation to this particular species of native forest, under the name of *Oak Openings.* *J. F. Cooper,* Oak Openings, i.

**opera**1 (op′e̤-rä̤), *n.* [= F. *opéra* = Sp. Pg. *opera* = D. *opera* = G. *oper* = Sw. Dan. *opera,* ‹ It. *opera,* an opera, orig. composition as opposed to improvisation, ‹ L. *opera,* f., work, connected with *opus* (*oper-*), neut., work, toil: see *opus.*] **1.** A form of extended dramatic composition in which music is an essential and predominant factor; a musical drama, or a drama in music. The opera is one of the chief forms of musical art; on many grounds it is claimed to be the culminating musical form. At least it affords opportunity for the application of nearly every known resource of musical effect. Its historical beginning was doubtless in the musical declamation of the Greeks, especially in connection with their dramatic representations. The idea of a musical drama was perpetuated during the middle ages under the humble guise of mysteries or miracle-plays, in which singing was an accessory. The modern development began in Italy near the close of the sixteenth century, when an attempt was made to revive the ancient melodic declamation, an attempt which led directly to the discovery and establishment of monody and harmony in the place of the medieval counterpoint, of the recitative and the aria as definite methods of composition, and of instrumentation as an independent element in musical works. The modern opera involves the following distinct musical constituents, combined in various ways: (*a*) *recitatives,* musical declamations, mainly epic or dramatic in character, with or without extended accompaniment; (*b*) *arias, duets,* or *trios,* melodies for one, two, or three voices, constructed in a more or less strict musical form, predominantly lyrical in character, and usually with carefully elaborated accompaniments; (*c*) *choruses* and *concerted numbers* of various form, in which the dramatic element generally predominates, and which are often wrought into noteworthy climaxes of great musical and dramatic interest; (*d*) *instrumental elements,* including both accompaniments and independent passages, the former varying from the merest harmonic groundwork for declamation to a detailed instrumental commentary upon the dramatic emotions and situations as they succeed each other, and the latter including overtures, intermezzi, marches, dances, etc., which either introduce, connect, supply, or embellish the links in the chain of dramatic incident. To these may be added dancing, or the ballet, which is introduced either as an incidental diversion or as a component part of the dramatic action itself. In the older operas the successive numbers or movements are sharply separated from each other, while in recent ones the action is continuous except at one or two principal points. In Italy the opera has had an unbroken course of development since before 1600. It began to be diligently cultivated in France and Germany about 1650, and in England somewhat later. Every leading modern composer, except Mendelssohn, has contributed more or less to its literature. Italian operas have tended toward a lyrical extreme, to the neglect of dramatic consistency and truth, while German operas have strongly emphasized the romantic and strictly dramatic elements. French operas have often sought much for comic or spectacular effects. The Wagnerian theory of the opera presents some peculiarities, especially in the obliteration of the distinction between the recitative and the formal aria, in the remarkable elaboration of the orchestral effects, and in the unification of the poetic, musical, dramatic, and scenic elements, though these characteristics were foreshadowed in the works and theories of earlier masters. The maintenance of expensive opera-houses, with regular seasons of performances annually, is a matter of governmental appropriation in most European countries. The opera has therefore become a powerful factor in the social and artistic life of many cities. Operas are often described by such qualifying terms as *grand* or *serious, dramatic, comic,* etc. Grand operas have an elaborate plot, and the entire work is set to music; while comic operas frequently contain spoken dialogue. In common speech, *German opera* means opera in German; *Italian opera,* opera in Italian, etc. A *ballad-opera* is a light dramatic work into which ballads or popular songs are arbitrarily introduced.

> An *Opera* is a poetical tale or fiction, represented by vocal and instrumental musick, adorned with scenes, machines, and dancing. *Dryden,* Albion and Albanius. Pref.

The principles of construction are various. A common form has a ratchet-wheel connected with registering-dials, and an oscillating lever which by suitable mechanism is made to take up a single ratchet-tooth at each to-and-fro movement of a reciprocating or oscillating part, such as the cross-head of a steam-engine. Another form has a spear-pointed spindle which is connected with a registering mechanism, the whole implement being held in the right hand, and the point of the spindle being pressed into the center at the end of the shaft whose revolutions are desired to be counted. Ophicleide.

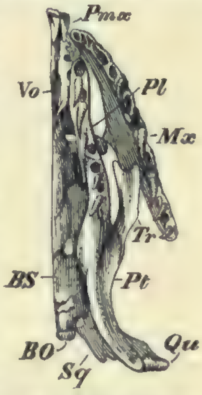
**ophicleide** (of'i-klīd), *n.* [< Gr. ὄφις, a serpent, + κλείς (κλειδ-), a key: see *clavis*.] A metal musical wind-instrument, invented about 1790, having a large tube of conical bore, bent double, with a cupped mouthpiece. It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood; it is the bass representative of the keyed-bugle family. The tones produced are the harmonics of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual bass variety) on the third B below the middle C, with all the semitones—all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable, and as its tone is highly resonant and pungent it is an important orchestral instrument. The alto ophicleide is pitched a fifth higher than that described above, while lower varieties also occur.

**ophicleidist** (of'i-klī-dist), *n.* [< *ophicleide* + *-ist*.] A performer on the ophicleide.

**Ophideres** (ọ-fid'ẹ-rēz), *n.* [NL. (Boisduval, 1832), prop. **Ophioderes* (cf. Gr. ὀφιόδειρος, serpent-necked), < ὄφις, a serpent, + δέρη, Attic δειρή, neck, throat.] The typical genus of *Ophideridæ*, having the palpi spatulate or clavate, and the hind wings luteous. It is very widely distributed in both hemispheres; the species are large and often beautifully colored. *O. fullonica* of South Africa damages oranges by piercing them with its haustellum and sucking the juice.

**Ophideridæ** (of-i-der'i-dē), *n. pl.* [NL. (Guenée, 1852), < *Ophideres* + *-idæ*.] A family of noctuid moths of large size and striking coloration, represented by *Ophideres* and five other genera in nearly all faunæ except the European.



Base of Ordinary Ophidian Skull (python).

*BO*, basioccipital; *BS*, basisphenoid; *Mx*, maxillary; *Pmx*, premaxillary; *Pl*, palatine; *Pt*, pterygoid; *Qu*, quadrate; *Sq*, squamosal; *Tr*, transverse bone; *Vo*, vomer. (The teeth are aglyphodont.)

**Ophidia** (ọ-fid'i-ạ̈), *n. pl.* [NL., pl. of **ophidium*, < Gr. ὀφίδιον, dim. in form, but not in sense, of ὄφις, a serpent; or improp. for **Ophioidea*, < Gr. ὄφις, a serpent, + εἶδος, form.] An order of the class *Reptilia*, without developed limbs, with mobile quadrate bone and separate mandibular rami; the snakes or serpents. The name was introduced to replace *Serpentes* of Linnæus, and at first included not only serpents in a proper sense, but certain footless lizards, and even the amphibians of the family *Cæciliidæ*. In *Ophidia* proper there is never any trace of fore limbs, and at most very rudimentary hind limbs, represented externally by mere anal spurs or processes of the integument. There is no sternum. The ribs are very numerous, and are so arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebræ are procœlous, very numerous, not united in any sacrum, and bearing no chevron-bones. The skull has no quadratojugal arch nor parietal foramen; the lower jaw is articulated with a movable quadrate bone, and its rami are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is enormously distensible. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one or both jaws, usually in both; they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have no movable lids, the cuticle extending directly over the eyeball. The cuticle is scaly, forming many very regularly arranged rows of scales on the upper parts, and usually larger modified scutes on the under side, called *gastrosteges* and *urosteges*, serving to some extent for locomotion. There is a pair of extracloacal penes in the male; the female is oviparous or ovoviviparous. *Ophidia* are variously subdivided—by Duméril and Bibron into *Opoterodonta*, *Aglyphodonta*, *Proteroglypha*, and *Solenoglypha*, an arrangement substantially now current, though with some modifications. Cope's latest arrangement is *Epanodonta*, *Catodonta*, *Tortricina*, which are opoterodont, *Asinea*, which are aglyphodont, *Proteroglypha*, and *Solenoglypha*. There are 20 families and about 300 genera, of which more than 200 belong to the family *Colubridæ* alone. See also cut under *Python*.

(1) In Bonaparte's early systems the *Ophidiidæ* embraced two subfamilies, *Ophidiini* and *Ammodytini*. (2) In Günther's system they are a family of gadoid fishes corresponding to the modern *Ophidioidea*. (3) In Gill's system the family is restricted to those *Ophidioidea* which have the ventral fins under the chin, bifid barbels, and the anus in the anterior half of the length of the fish, represented by four genera. See cut at *Ophidium*.

There is but one species, *O. paradoxum*, the snakenut-tree, native in Guiana, a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. **Ophiocephalidæ** (of″i-ō-se-fal′i-dē), *n. pl.* [NL., < *Ophiocephalus* + *-idæ*.] A family of fishes, typified by the genus *Ophiocephalus*; the walking-fishes. They have a long subcylindric body covered with small scales, and a snake-like head shielded on top with large scales, a long spineless dorsal fin, and usually six-rayed thoracic ventrals. These remarkable fishes breathe air by means of an air-chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools and similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in semi-fluid mud or lying torpid below the hard-baked crust of a tank or pool from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aërial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

**ophiocephaloid** (of″i-ō-sef′a-loid), *a.* and *n.* **I.** *a.* Resembling an ophiocephalus; belonging to the *Ophiocephalidæ*, or having their characters.

The species are natives of the East. They are furnished with a cavity to supply water to the gills, and are able to live a long time out of water, and often travel considerable distances from one pool to another. The *O. gachua* (the *coramota* or *gachua* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. It is a kind of cobra, very closely related to *Naja*, the chief technical distinction being the presence of postparietal plates on the head. *O. elaps*, the hamadryad, is one of the largest and most deadly of serpents; it is known to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

**ophite**1 (of′īt), *a.* [< Gr. ὀφίτης, of or like a serpent, < ὄφις, a serpent.] Pertaining to a serpent.

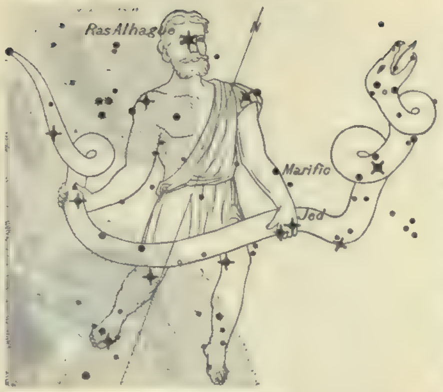
**ophite**1 (of′īt), *n.* [< L. *ophites*, also *ophitis*, serpentine stone (see *ophites*), < Gr. ὀφίτης, fem. ὀφῖτις, of or like a serpent: see *ophite*1, *a.*] A name originally applied to certain eruptive (diabasic or doleritic) rocks occurring in the Pyrenees, and later used with similar meaning for rocks found in Spain, Portugal, and northern Africa. In many of these the augite has become converted into uralite, hence they had previously been often classed with the diorites. Michel Lévy divides the French ophites into two types, the first distinguished by the presence of large proportions of the augitic or uralitic constituent, the second by a large predominance of plagioclase. The composition of the rocks which have been designated by different lithologists as *ophites* is variable, and their relations have not yet been fully worked out.

**Ophite**2 (of′īt), *n.* [< LL. *Ophitæ*, < LGr. Ὀφῖται (also Ὀφιανοί), pl., < Gr. ὀφίτης, of or pertaining to a serpent: see *ophite*1, *n.*] A member of a Gnostic body, of very early origin, especially prominent in the second century, and existing as late as the sixth century. Its members were so called because they held that the serpent by which Eve was tempted was the impersonation of divine wisdom, the great teacher and civilizer of the human race. They were also called *Naassenes* (from Hebrew *nāchāsh*, a serpent). See *Sethian*.

**ophites** (ọ-fī′tēz), *n.* [L., < Gr. ὀφίτης (sc. λίθος), serpentine stone, so called, according to Pliny, because it is spotted like a snake, or, as was fancifully thought, because a person carrying it might walk among serpents with impunity: see *ophite*1.] A stone mentioned by various Greek and Latin authors, the word designating several quite different things. It is impossible to identify with certainty any one of the various substances, some of which were unquestionably fabulous, to which the name *ophites* was given by Orpheus, Dioscorides, Pliny, and other classic writers. Pliny distinguishes two kinds of ophite, the hard and the soft. The former may have been some variety of granite; the latter, a variety of serpentine, perhaps the Tuscan gabbro or ophiolite. From a very early time, various rounded stones or petrifactions, more or less egg-shaped in form, and called by various names, *ovum anguinum*, *ophites*, *serpent-stone*, *adderhead*, *Druidical bead*, etc., have been held in high veneration, and endowed with extraordinary virtues. The ovum anguinum described by Pliny would appear from his description to have been a fossil echinoderm. Glass spindle-whorls, which are known to have been in use within the past four hundred years, have been sold at a recent day as the true ovum anguinum; and fossil echinoderms have also been within a few years treasured as Druidical relics, and regarded as possibly possessing a portion, at least, of the virtues attributed by the ancients to the ophites.

**ophitic** (ọ-fit′ik), *a.* [< *ophite*1 + *-ic*.] An epithet applied by various lithologists to a structure, especially characteristic of certain diabases and dolerites, in which the augitic constituent is separated into thin plates by interposed lath-shaped crystals of plagioclase, although the identity of the augite crystal is not lost, as is shown by the similar optic orientation of the separated portions.

**Ophiuchus** (of-i-ū′kus), *n.* [L., < Gr. ὀφιοῦχος (tr. by L. *Anguitenens* as well as *Serpentarius*), a constellation so called, lit. 'holding a serpent,' < ὄφις, a serpent, + ἔχειν, hold: see *hectic*.] An ancient northern constellation, representing a man holding a serpent; the Serpent-bearer. Also called *Serpentarius*. The Serpent is now treated as a separate constellation.



Ophiuchus and Serpent.

> Incensed with indignation, Satan stood
> Unterrified, and like a comet burn'd,
> That fires the length of *Ophiuchus* huge
> In the arctic sky. *Milton*, P. L., ii. 709.

**Ophiura** (of-i-ū′rạ̈), *n.* [NL., < Gr. ὀφίουρος, serpent-tailed, < ὄφις, a serpent, + οὐρά, a tail.] A genus of sand-stars or brittle-stars, variously restricted by different authors. The term is used with great latitude of definition, and gives name to a family and to the whole order to which it belongs. In the late most restricted sense it is discarded, and *Ophioderma* is substituted, giving name to a family *Ophiodermatidæ*.

**ophiuran** (of-i-ū′rạn), *a.* and *n.* **I.** *a.* Of or pertaining to the genus *Ophiura* in any sense, or to the order *Ophiuroidea*.

**Ophiuridæ** (of-i-ū′ri-dē), *n. pl.* [NL., < *Ophiura* + *-idæ*.] A group of ophiurans. (*a*) In the widest sense, the whole order *Ophiuroidea*. (*b*) In a middle sense, the ordinary ophiurans with simple arms. (*c*) In the narrowest sense, the family represented by *Ophiura* or *Ophioderma*, and now called *Ophiodermatidæ*. See cut under *Astrophyton*.

The mouth is pentagonal, and each angle is composed of five pieces. The order falls naturally into two leading divisions, according as the arms are simple or branched. These are sometimes called families, *Ophiuridæ* and *Astrophytidæ*; sometimes they are considered as suborders, when the former group is known as *Ophiurida* or *Ophiureæ*, and further subdivided into several families, of which the *Ophiuridæ* proper constitute one. = **Syn.** The uses of *Ophiura* and its derivatives are almost inextricably blended; but in general (*a*) *Ophiuroida* or *Ophiuroidæ* or *Ophiuroidea* or *Ophiuroideæ* are the major terms of the series, naming the whole group of ophiurans; (*b*) *Ophiurida*, *Ophiuridæ*, *Ophiuridea*, *Ophiurea*, *Ophiureæ* are middle terms designating the simple ophiurans as distinguished from the euryaleans or *Astrophytidæ*; and (*c*) *Ophiuridæ* is the minor term, designating a restricted family.

Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally; in large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least sixteen other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

**opossum** (ọ-pos'um), *n.* [Formerly also *opassom*; also, and still in rural use, abbr. *possum*, formerly *possowne*; Amer. Ind.] 1. An American marsupial mammal of the family *Didelphyidæ* (which see for technical characters). They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous, eating flesh and carrion, reptiles, insects, and fruits. The head is conical, and the snout somewhat resembles that of a pig; the ears are large, leafy, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 13 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are uncleanly, the flesh is white and palatable, especially in the autumn, when they feed much on fruits, and become as fat as pigs. They commonly appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of animation, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphys*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best-known is *D. virginiana*. There are perhaps a dozen others, among them pouchless ones, as *D. dorsigera*. The yapoks or water-opossums of South America form another genus, *Chironectes*.

Common Opossum (*Didelphys virginiana*).

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possowne*, which hath a bag under her belly, out of which she will let forth her young ones, and take them in again at her pleasure. The other is the flying Squerril.

*Milton*, P. L., i. 288.

2. Of or pertaining to the eye as the organ of vision; ocular; ophthalmic.—3. Relating to the science of optics.

Where our master handleth the contractions of pillars, we have an *optick* rule that the higher they are the less should be always their diminution aloft, because the eye itself doth naturally contract all objects, more or less, according to the distance.
*Sir H. Wotton*, Elem. of Architecture, i.

**Basal optic ganglion.** See *ganglion.*—**Brachia of the optic lobes.** See *brachium.*—**Dispersion of the optic axes.** See *dispersion.*—**Optic angle.** (*a*) The angle included between the two lines drawn from the two extremities of an object to the first nodal point of the eye; the visual angle. (*b*) The angle which the visual axes of the eyes make with one another as they tend to meet at some distance before the eyes. (*c*) The angle between the optic axes in a biaxial crystal.—**Optic axis.** (*a*) See *axis*$^{1}$. (*b*) The line in a doubly refracting crystal in the direction of which no double refraction occurs. Crystals belonging to the tetragonal and hexagonal systems have a single optic axis, coincident with their vertical crystallographical axis: hence they are said to be *uniaxial.* Crystals belonging to the orthorhombic, monoclinic, and triclinic systems have two optic axes, and hence are *biaxial.*—**Optic chiasm**, in *anat.*, the commissure, decussation, or chiasm of the right and left optic nerves. See *chiasm*, and cuts under *brain* and *corpus.*—**Optic commissure.** Same as *optic chiasm.*—**Optic cup**, a concave or cup-like area formed by the involution of the distal extremity of the primary optic vesicle.—**Optic disk**, the slightly oval area on the retina formed by the entrance of the optic nerve. It is somewhat elevated, and is also called the *optic papilla, colliculus nervi optici*, and *porus opticus.*—**Optic foramen.** See *foramen.*—**Optic ganglia**, the corpora quadrigemina or bigemina.—**Optic groove**, the groove lodging the chiasm on the upper surface of the sphenoid bone, in front of the olivary eminence.—**Optic lobes** (lobi optici), the dorsal part of the midbrain or mesencephalon. The lobes are paired, right and left, and hence called *corpora bigemina*, in animals below mammals. In man and other mammals each lobe is also marked by a cross-furrow, so that the two lobes form four protuberances, whence they are called *corpora quadrigemina*, and consti-

tute what are called in human anatomy the *nates* and *testes* of the brain. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and lie uncovered upon the surface of the brain; they are quite large in reptiles and birds; small in mammals (in man smallest in proportion both to the cerebrum and to the cerebellum), and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *cerebral* and *corpus*.—**Optic nerves** (nervi optici), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phrase is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*1.—**Optic neuritis.** See *neuritis*, and cuts under *corpus* and *eye*1.—**Optic pad**, a pad-like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla.** Same as *optic disk*.—**Optic peduncle**, in crustaceans, an eye-stalk or ophthalmite.—**Optic stalk**, in mollusks, a soft process of the head upon which the eye is supported, as in various snails, etc.; an ommatophore. See *Stylommatophora*.—**Optic thalamus**, a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the optic nerve. Also called *thalamus*. See cuts under *cerebral* and *corpus*.—**Optic tract** (tractus optici), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crura, to which they are closely attached.—**Optic tubercles**, the corpora quadrigemina. See *bigeminum*.—**Optic vesicles**, in *embryol.*, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain. =**Syn.** *Optic*, *Optical*. The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics: as, *optic* nerve, tract, lobe; *optical* angle, center, effect.

**II.** *n.* **1.** The eye. [Now chiefly colloq.]

> Quickly cold Indiff'rence will ensue,
> When you Love's Joys thro' Honour's *Optic* view.
> *Prior*, Celia to Damon.

> She screwed her dim *optics* to their acutest point, in the hope of making out with greater distinctness a certain window. *Hawthorne*, Seven Gables, xvi.

Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within the lens; in a plano-convex or plano-concave lens it is the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center.—**Optical circle**, in *physics*, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or, when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter, equation, glass, meteorology, square**, etc. See the nouns. =**Syn.** See *optic*.

Between the eye and the speculum is a piece of parallel-faced glass with a small dot on its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye-end traces the delineation on paper.

The most characteristic moments of the doctrine are two: first, that the Creator selected this universe from a number of others which he might have created; and, second, that all of these presented certain imperfections or disadvantages which omnipotence could not avoid. (*b*) The doctrine that the universe advances on the whole, so as to be tending toward a state in the indefinite future different in its general character from that in the indefinite past. This is better called *evolutionism*. It is opposed to *pessimism*, which holds that the universe is tending to the nothingness from which it sprang, and to *Epicureanism*, which holds that the universe is not tending from any general state to any other general state. **2.** The belief, or disposition to believe, that whatever exists is right and good, in some inscrutable way, in spite of all observations to the contrary.

> The Christian *optimism* is the recognition that in a spiritual world a spiritual being, as such, cannot find an absolute limit or foreign necessity, against which his life must be broken in pieces; but that, on the contrary, all apparent outward limits, and even death itself, are for it but the means to a higher freedom and realisation of self. *E. =**Syn.** *Opulence, Wealth, Riches, Affluence.* All these words imply not only the possession of much property, but the possession of it under such circumstances that it can be and is enjoyed. They seem contrasted not only with their opposites, but with the possession of a moderate amount. *Opulence* is a dignified and strong word for *wealth*. *Wealth* and *riches* may mean the property possessed, and *riches* generally does mean it; the others do not. *Affluence* suggests the flow of wealth to one, and resulting free expenditure for objects of desire. There is little difference in the strength of the words.

'Οποῦς ('Οπουντ-), a town of Locris in Greece, where some cactus-like plant, "herba Opuntia," is mentioned by Pliny as growing.] A genus of cacti, type of the tribe *Opunticæ* in the order *Cactaceæ*, having the stamens shorter than the half-erect petals. There are about 200 species, of warmer America, with one species widely scattered throughout the Old World. They are fleshy herbs, shrubby plants, or sometimes trees, their branches usually composed of flattened or globose joints, with hairy tubercles which are set with sharp spines. They bear small scale-like leaves on the younger branches, lateral yellow, red, or purple flowers, and pear-shaped berries. For uses and names, see *cochineal* and *prickly-pear*; also *Indian fig* (under *fig*2), *hedgehog-thistle*, and *tuna*.

(Bentham and Hooker, 1865), < *Opuntia* + *-eæ*.] A tribe of polypetalous plants of the order *Cactaceæ*, distinguished by the short calyx-tube, not prolonged beyond the ovary. It contains 4 genera, of which *Opuntia* is the type and only important one, and about 250 species, principally American. They are succulent perennials, shrubs or sometimes trees, armed with sharp spines. Their usually lateral and large flowers are followed by pear-shaped or roundish berries. See cut under *Opuntia*.

**opus** (ō′pus), *n.*; pl. *opera* (op′e-rä). [L., work, a work: see *opera*.] Work; a work, as a literary or musical composition (in the latter use often abbreviated *op.*). The published works of a musical composer are frequently numbered in order for reference: as, *Op.* 28. A single opus may contain two or more numbers: as, *Op.* 48, No. 3.—**Opus Alexandrinum**, Alexandrian work: a type of mosaic pavement consisting of geometric figures in black and red tesseræ on a white ground.—**Opus araneum**, a kind of needlework done in white thread, with figures of men, angels, and animals, liturgical vessels, etc. The name is given especially to such work of the fourteenth and fifteenth centuries.—**Opus filatorium**, the ancient name for fancy work of all sorts done with threads, including drawn and darned embroidery, and all kinds of netting and the like; especially, an embroidery in thread or colored silk on a fabric of small square meshes, sometimes having a pattern cut out of thin stuff applied and edged with needlework.—**Opus incertum** or **opus antiquum**, masonry formed of small rough stones set irregularly in mortar, and in some examples traversed by beds of bricks or tiles.—**Opus insertum**, in *masonry*, regular stonework in which the vertical joints of every course fall in the middle of the blocks of the courses immediately above and below.—**Opus interrasile**, decoration produced by cutting away the ground, leaving the pattern, or cutting out the pattern, so that the openings form the design.—**Opus lateritium**, in *ancient masonry*, brickwork or tilework.—**Opus magnum** or **magnum opus**, a great work; a literary or artistic work on which one spends his best powers.—**Opus musivum**, mosaic.—**Opus operantis**, literally, the work of the worker; in *theol.*, the effect of a sacrament considered as proceeding from the spiritual disposition or condition of the recipient. The doctrine that the sacraments confer benefits *ex opere operantis*, from the act of the person acting or taking part in them, is regarded as a distinctively Protestant view, in opposition to the doctrine that the benefit is derived *ex opere operato*.—**Opus operatum**, literally, a work wrought; in *scholastic* and *Roman Catholic theology*, the due celebration of a sacrament, considered as necessarily and inherently involving the grace of the sacrament. Sacramental grace is said by Roman Catholic theologians to be conferred *ex opere operato*, 'from the (sacramental) act performed,' the sacrament deriving its power from the institution of Christ, and not from the merit of the minister or recipient. Sacraments are therefore viewed as conveying grace to the recipient, unless by want of the due dispositions, such as faith, love, repentance, etc., he wilfully interposes a barrier which prevents his receiving the grace. Certain schoolmen are thought to have taught that the sacraments produce their full effect in all cases without restriction, and this doctrine has often been imputed by Protestant controversialists to the Roman Catholic Church, instead of that contained in the decrees of the Council of Trent (session vii., canon viii.) as explained by Bellarmine and others, and given above. Anglican theologians have sometimes used this phrase to express the doctrine of the Church of England that the inward grace is one of the two integral parts of a sacrament (Catechism), that the sacraments are signs which are effectual (Article xxv.), and that, as the English bishops declared at the Savoy conference, "sacraments have their effects where the receiver doth not 'ponere obicem,' put any bar against them." *Procter*, Book of Common Prayer (Amer. ed.), p. 124.—**Opus phrygicum**, in the middle ages, embroidery. Compare *Phrygian work* (under *Phrygian*) and *auriphrygia*.—**Opus plumarium**, an old name for *feather-stitch*.—**Opus punctatum**. Same as *pounced work*.—**Opus reticulatum**, in *masonry*, regular stonework or brickwork in square blocks, the courses of which are inclined at an angle of 45° to the horizon, so that the joints resemble a network.—**Opus Saracenicum**, Saracenic work (that is, tapestry, rugs, etc.), imported from the East.—**Opus sectile**, a kind of pavement formed of slabs or tiles of glass or other material, the pieces having a definite size, far larger than the tesseræ of ordinary mosaic. They are sometimes of plain color and sometimes mottled and veined.—**Opus signinum**, a kind of tough cement or stucco used by the ancient Romans to coat the interior of aqueducts, etc.—**Opus spicatum** herring-bone masonry.—**Opus tessellatum**, a pavement with designs executed in pieces of different colors, called *tesseræ* or *tesselæ*, of larger size and more regular form than the pieces used in mosaic.

Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Pers. *nār*, a pomegranate. Cf. *lemon* and *lime*3, also of Pers. origin.] I. *n.* 1. The fruit of the orange-tree, a large globose berry of eight or ten membranous cells, each containing several seeds which are packed in a pulp of fusiform vesicles, distended with an acidulous refreshing juice. There are three principal varieties of the orange—the sweet or China orange, *Citrus Aurantium* proper, including the ordinary market sorts; the bitter or Seville orange or bigarade, variety *Bigaradia*, used for making marmalade, its peel being specially valued; and the bergamot orange, variety *Bergamia*, classed by some, however, as a variety of *Citrus Medica* (see *bergamot*1, 1).
2. A rather low branching evergreen fruit-tree, *Citrus Aurantium*, with greenish-brown bark, elliptical or ovate coriaceous leaves, the petiole often winged, and fragrant white flowers. It is long-lived and extremely prolific. When no longer fruitful, its hard, fine-grained, yellowish wood is valued for inlaid work and fine turnery. Its flowers are prized when fresh (see *orange-blossoms*), and (chiefly those of the bitter orange) yield neroli-oil and orange-water. The varieties of the orange are very numerous, distinguished most obviously by their fruit. Its origin is referred to India, whence it spread to western Asia, thence reaching Spain and Italy, through the agency of the Moors and the crusaders, between the eleventh and fourteenth centuries. It is now cultivated in nearly all tropical and subtropical lands, including China and Japan, the whole Mediterranean basin, the West Indies, and the southern borders of the United States, having, indeed, become thoroughly wild in Florida.

The male attains a stature of 4 feet or a trifle more, with a reach of the arms of above 7½ feet. The relative proportions of the arms and legs are thus very different from those of man, in whom the height and the reach of the arms are nearly the same. The arms of the orang-utan reach nearly to the ground when the animal stands erect. This attitude is difficult and constrained, and is not ordinarily assumed. The animal is most at home in trees, where it displays extraordinary agility. In walking on level ground it stoops forward, brings the hands to the ground, and swings the body by the long arms, much as a lame person uses crutches. Both hands and feet are long and narrow, with bent knuckles and short thumbs and toes, so that the palms and soles cannot be pressed flat upon plane surfaces. The face, hands, and feet are naked, and the fur is scanty or thin, though rather long; it is of a brownish-red or auburn color. Orang-utans live in trees, where they build large nests and feed on fruits and succulent buds or shoots. The strength of the animal is great in proportion to its size, and when brought to bay it proves a formidable antagonist. Also *orang.*

**oratorio** (or-ạ̄-tō′ri-ō), *n.* [< It. *oratorio*, < LL. *oratorium*, a place of prayer, an oratory or a chapel. The name was originally given to sacred musical works because they were first performed in the oratory of the church of Sta. Maria in Vallicella, under the patronage of Philip Neri: see *oratory*.] **1.** A place of worship; a chapel; an oratory.—**2.** A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery. The modern oratorio and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (for which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the oratorio began to be clearly differentiated from the opera, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious and reflective treatment of both arias and choruses, and in the freer use throughout of contrapuntal resources. The oratorio, therefore, came to belong essentially to the class concert music, with more or less of the qualities of church music. The true oratorio style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England. The strong predilection which existed before 1600 for passion-plays led in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion according to St. Matthew" of J. S. Bach. In England the works of Handel in the early part of the eighteenth century initiated an interest in the concert oratorio which has been constant and wide-spread. The method of treatment of the English oratorio has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the oratorio style in general has seldom attained to the passionate intensity and complexity of the opera, it has outstripped the latter in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the chorus as a separate artistic means, so that most oratorios are essentially choral works. The oratorio has never occupied the same position of social importance as the opera, but it has perhaps contributed more to the world's store of new artistic conceptions.

The orbits of the planets are elliptical, having the sun in one of the foci; and they all move in these ellipses by this law—that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Kepler's laws* (see *law*$^1$). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called *orbits*. The *elements of an orbit* are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric or the deferent of its epicycle.

Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrymal, and malar, of which the first-named three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are—with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fossæ by the lacrymal canal; with the temporal and zygomatic fossæ by the sphenomaxillary fissure; with ethmoidal parts by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associate muscular, vascular, glandular, sustentacular, mucous, and nervous structures.

L. *orchestra*, the place where the senate sat in the theater, also the senate itself, prop. the orchestra), < Gr. ὀρχήστρα, a part of the stage where the chorus danced, the orchestra, < ὀρχεῖσθαι, dance.] 1. The part of a theater or other public place appropriated to the musicians. (*a*) In theaters, in classic times, the orchestra was a circular or semicircular level space lying between the rising tiers of seats of the auditorium and the stage. In Greek theaters this space was circular, and was allotted to the chorus, which performed its evolutions about the thymele or altar of Dionysus, which occupied the center of the orchestra. Among the Romans the orchestra corresponded nearly to the orchestra of modern play-houses, and was set apart for the seats of senators and other persons of distinction. See diagram under *diazoma*. (*b*) In a modern theater or opera-house, the place assigned for the orchestra-players is usually the front part of the main floor. In the opera-house at Bayreuth the orchestra is below the level of the floor, so that the players are invisible to the audience. (*c*) The parquet.

2. In *mod. music*, a company of performers on such instruments as are used in concerted music; a band. (In the United States *band* usually signifies a military band; but in England *band* is interchangeable with *orchestra*.) The historic development of the orchestra as now known did not begin until about 1600, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (*a*) the *strings*, including violins (first and second), violas, violoncellos, and bass viols, these together constituting the largest and decidedly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (*b*) the *wood wind*, including flutes, oboes, clarinets, English horns, basset-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (*c*) the *brass wind*, including French horns, trumpets, cornets, trombones, ophicleides, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (*d*) the *percussives*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the pianoforte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A *full orchestra* is one in which all these groups are present in fairly complete form; a *small orchestra* is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera-houses or supported by the proceeds of popular concerts.

It includes about 5,000 species, belonging to 348 genera, classed in 5 tribes and 27 subtribes. They are perennial herbs, some terrestrial, found both in the tropics and in colder regions, even to 68° N. lat., others epiphytes of tropical climates, reaching north to Florida. Their flowers are generally beautiful and fragrant, often grotesque or imitating animal forms, and have three sepals, two similar petals, and a third petal, the lip, enlarged, and commonly of singular shape or color. Their pollen is coherent in a waxy or granular mass, usually transferred to the stigma only by insect-visits, insuring cross-fertilization. They grow from short or creeping rootstocks, tubers, or thickened fibers, the epiphytic species commonly with a few lower joints of the stem thickened and persisting, forming a pseudo-bulb. They bear undivided, often fleshy, parallel-veined leaves, and one-celled capsules with a multitude of minute seeds. Any plant of the order is called an *orchid*.

The technical use of the word, the disappearance of *or-* as a significant prefix, and the remoteness of the main element *-deal* from its etym. meaning, led to a separation of the word from its actual source, and its treatment as of L. origin; hence the ordinary pron. in three syllables (as if the termination were like that of *real*, *ideal*, etc.), instead of the orig. two (ôr′dēl).] I. *n.* 1. A form of trial to determine guilt or innocence, formerly practised in Europe, and still in parts of the East and by various savage tribes. It consisted in testing the effect of fire, water, poison, etc., upon the accused. Well-known fire-ordeals in England were the handling of red-hot irons, or the walking over heated plowshares. A common form of the water-ordeal was the casting of the accused into water: he was considered innocent if he sank, guilty if he floated. The practice of "ducking witches" is a survival of this water-ordeal, and the phrase "to go through fire and water" probably alludes to those customs. These ordeals were abolished in England in the reign of Henry III., but the wager of battle remained. The ordeal of poison-water is common in Africa; that of burning candles, in Burma; that of eating rice, in Siam, etc.

By *ordal* or by ooth,

(*b*) One of the several degrees or grades of the clerical office. In the Roman Catholic Church these orders are bishop, priest (presbyter), deacon, subdeacon, acolyte, exorcist, reader, and doorkeeper. Originally the first three were accounted *major orders* and the others *minor orders*. Since the twelfth century the order of subdeacon has been advanced to the rank of a major order, and the number of orders is generally counted as seven, the orders of bishop and presbyter being regarded as one order in so far as the sacerdotal character belongs to both. In the Orthodox Greek and other Oriental churches the major orders are those of bishop, priest, and deacon, and the minor orders are subdeacon, reader (anagnost), and sometimes singer (psaltes). The orders of bishop, priest, and deacon are known not only as *major* or *holy orders*, but as *apostolic orders*. The orders of subdeacon, acolyte, exorcist, and doorkeeper (ostiary) existed in the Western Church before the middle of the third century; those of subdeacon, exorcist, reader, singer, and doorkeeper were as old as the third or fourth century in the Eastern Church. The Anglican Church retains only the orders of bishop, priest, and deacon. Major orders can be conferred by bishops only. Chorepiscopi, abbots, and priests have sometimes, however, been authorized to confer minor orders.

They cannot abide

(*c*) In the Roman Catholic, Greek, Anglican, and other episcopal churches, the sacrament or rite of ordination, by which ecclesiastics receive the power and grace for the discharge of their several functions: specifically termed *holy order*, or more commonly *holy orders*. The bishop alone can administer this rite. Orders as a sacrament or sacramental rite are limited to the major orders.

5. (*a*) In *zoöl.*, that taxonomic group which regularly comes next below the class and next above the family, consisting of one or more families, and forming a division (sometimes the whole) of a class. Like other classificatory groups, it has only an arbitrary or conventional taxonomic value. Compare *superorder*, *suborder*. (*b*) In *bot.*, the most important unit of classification above the genus, corresponding somewhat closely to *family* in zoölogy. See *family*, 6. In phanerogams the term *family* is not technical or systematic, being sometimes applied to suborders, tribes, or even genera. In cryptogams it is made a subdivision of the order by some authors. See *natural order*, under *natural*.

6. A number of persons of the same profession, occupation, or pursuits, constituting a separate class in the community, or united by some special interest.

*Shak.*, R. and J., v. 2. 6.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "Congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.
*Encyc. Brit.*, XVI. 715.

(*b*) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knights companions*, *officers*, *commanders*, *grand officers*, and *grand commanders*, otherwise called *grand cross* or *grand cordon*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among foreigners only sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain): it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best-known type. Two of the orders of merit may be regarded as somewhat exceptional—the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of design peculiar to the order, a star, cross, jewel, badge, ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order; and the word *order* is often applied to the decoration or badge. See *bath*, *garter*, *knighthood*, *star*, *thistle*, etc.

**10.** In *rhet.*, the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject.—**11.** In *classical arch.*, a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders—Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts—base, shaft, and capital; the entablature into three parts also—architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are Roman orders, the other three are properly Greek, the Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

**12.** In *math.*: (*a*) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order of a relation* in *m*-dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to *m*; then the number of points satisfying these conditions is the order of the relation. Thus, the *order of a plane curve* is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. The *order of a non-plane curve* is the number of points in which the curve is cut by a plane. The *order of a surface* is the number of points in which the surface is cut by a right line. The *order of a congruence* is the number of points in which the congruence-lines lying in an arbitrary plane are cut by an arbitrary plane. The *order of a complex* is the number of points in which the curve enveloping the lines of the complex lying in an arbitrary plane is cut by an arbitrary plane. (*b*) In analysis, the number of elementary operations contained in a complex operation; also, that character of a quantity which corresponds to the degree of its algebraic expression. See the phrases below, and also *equation*.—**13.** Established rule, administration, system, or régime.

In the medieval English liturgical books the Latin title was *Ordinarium et Canon Missæ*, the ordinary and canon of the mass; in the Roman missal and in general Latin use the title is *Ordo Missæ*, the order of the mass, and the *Canon Missæ*, canon of the mass, is entered as a new title. Hence some writers call only that part of the mass which precedes the canon the *ordinary* or *ordo*.

The ordinaries are the oldest bearings, and in general the oldest escutcheons are those which are charged only with the ordinaries, or with these primarily, other charges having been added. The bearings most generally admitted as ordinaries are the eight following: bar, bend, chevron, chief, cross, fesse, pale, and saltire; but most writers add one, some two, and others a greater number, namely one or more of the following: bend sinister, inescutcheon, quarter or franc-quartier, pile, bordure. By some writers also the subordinaries and ordinaries are considered together under one head. The ordinaries are often called *honorable ordinaries*, to distinguish them from the subordinaries.

2. The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches, including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its wider sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order; and the service is regarded as conferring no special religious authority. See *institution*, *induction*, *installation*.

As a technical term, it designates all heavy pieces fired from carriages. Modern ordnance may be divided into two classes, *smooth-bore* and *rifled*. The former are all muzzle-loaders; the latter are subdivided into *muzzle-loaders* and *breech-loaders*. Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze*, *cast-iron*, *wrought-iron*, *steel*, or *mixed cast* (*wrought-iron* and *steel*) guns; according to the method of construction, they are called *solid* or *built-up* guns. **Board of ordnance.** (*a*†) Formerly, in Great Britain, a board, consisting of a master-general, surveyor-general, clerk, and storekeeper (usually members of Parliament), which provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of stores, equipment, etc. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterward dissolved. (*b*) A board composed of United States ordnance-officers distinguished for their attainments in the theory and practice of heavy ordnance, its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and is advisory to the chief of ordnance of the army.—**Bureau of Ordnance.** See *Department of the Navy*, under *department*.—**Master of the ordnance.** See *master*$^1$.—**Ordnance corps.** Same as *ordnance department*.—**Ordnance department.** See *department*.—**Ordnance storekeeper.** See *storekeeper*.—**Ordnance stores,** a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery forges, battery-wagons, and all machines for mechanical manœuvers and for transportation, tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments for artillery, cavalry, and infantry. The phrase "ordnance and ordnance stores," covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use.—**Ordnance survey,** the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties; and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4,000 or more inhabitants, $\frac{1}{500}$ of the linear measurement, which is equivalent to 126.72 inches to a mile, or 1 inch to 41⅔ feet; for parishes (in cultivated districts), $\frac{1}{2500}$ of the linear measurement, equal to 25.344 inches to a mile, or very nearly 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied, and roads, railways, canals, and other public works laid out and executed.—**Rifled ordnance.** See *rifled cannon*, under *cannon*.

> But in a history-piece of many figures, the general design, the *ordonnance* or disposition of it, the relation of one figure to another, the diversity of the posture, habits, shadowings, and all the other graces conspiring to an uniformity, are of . . . difficult performance.
> *Dryden*, Plutarch.

> Language, by the mere collocation and *ordonnance* of inexpressive articulate sounds, can inform them with the spiritual Philosophy of the Pauline epistles, the living thunder of a Demosthenes, or the material picturesqueness of a Russell. *Marsh*, Lects. on Eng. Lang., xiii.

**Ordovician** (ôr-dọ-vish'ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Barrande, etc. As limited in Wales, according to H. B. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Llandovery. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician does not appear in the text-book of geology recently issued by the director of the Geological Survey of Great Britain, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania Surveys, nor can the strata thus named in England be strictly parallelized with any one or more divisions of the Silurian as established in the United States.

A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called *ore*, however, it being understood that in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.

2. Metal; sometimes, specifically, a precious metal, as gold.

5. In *phren.*, any part of the brain supposed to have a particular office or function in determining the character of the individual, and to be indicated by one of the areas of cerebral surface recognized by phrenologists: as, the *organ* of acquisitiveness, of alimentiveness, of inhabitiveness, etc.—6. The largest, the most complicated, and the noblest of musical instruments, consisting of one or many sets of pipes sounded by means of compressed air, the whole instrument being under the control of a single player; a pipe-organ, as distinguished from a reed-organ. Historically, the principle of sounding a pipe pneumatically has been known from the earliest times. The combination of pipes or whistles into graduated series, so as to produce the tones of some sort of scale, appears in the primitive Pan's-pipe and in the Chinese cheng, both of which are blown by the breath, the latter being perhaps the actual prototype of the modern organ. Instruments of this general class seem to have been used in Europe from the first Christian centuries, having some apparatus for furnishing compressed air and a set of pipes the sounding of which was variously controlled. Soon after the tenth century great improvements were made, affecting every part of the mechanism. The process of mechanical development has been continuous ever since, and is still going on. The original impetus to this steady progress is due to the fact that the pipe-organ has been recognized ever since the fourth or fifth century as preëminently the church musical instrument. Until the sixteenth century no other instrument commanded the careful study of educated musicians. Its application to purely concert uses is comparatively recent. The modern pipe-organ consists essentially of three mechanical systems: the *wind-supply*, the compressed air used being technically called *wind*; the *pipework*, including the entire sound-producing apparatus; and the *action*, the mechanism by which the player controls the whole. The *wind-supply* includes two or more *feeders*, oblique bellows which are operated either by hand or by a water, gas, steam, or electric motor or engine; a *storage-bellows*, horizontal bellows into which the feeders open, and in which the air is kept at a uniform pressure by means of weights; *wind-trunks*, distributing the compressed air to the several parts of the instrument; and *wind-chests*, boxes directly under the pipes, in which are the valves for admitting the air to particular pipes or sets of pipes. Occasionally certain solo pipes are supplied with air from a special storage-bellows in which the tension is made greater by extra weights; such pipes are said to be *on extra* or *heavy wind*. The *pipework* includes a great variety of different kinds of pipes, made either of metal or of wood, arranged in sets called *stops* or *registers*, at least one pipe being usually provided in each set for each digital of the keyboard. In general, all pipes are either *flue-pipes*, which are either open at the upper end or plugged, or *reed-pipes*, the former producing tones through the impact of a stream of air upon the sharp edge or lip of a mouth in the side of the pipe, and the latter producing tones by the vibration of a tongue or reed placed over or in an orifice through which the air passes. (See *pipe*.) The pipes in a given set or stop are alike, except in size and pitch. The four principal qualities of tone produced are the true *organ-tone*, given by open metal flue-pipes of broad scale; the *flute-tone*, given by stopped wooden flue-pipes; the *string-tone*, given by open metal flue-pipes of narrow scale; and the *reed-tone*, given by reed-pipes of various shape and material. A stop whose tones correspond exactly with the normal pitch of the digitals with which the several pipes are connected is called an *eight-feet stop*; one whose tones are uniformly an octave lower is called a *sixteen-feet stop*; while those whose tones are uniformly one or two octaves higher are called *four-feet* and *two-feet stops* respectively. Stops whose tones are different from the normal pitch of the digitals used, or from their upper or lower octaves, are called *mutation-stops*, in distinction from the above *foundation-stops*. Stops that have more than one pipe to the digital are called *mixture-stops* or *mixtures*. It is customary to group together several stops of different construction, tone-quality, and pitch upon a single wind-chest, and such a group of stops constitutes a *partial organ*. Usually from two to five such groups of stops or partial organs are introduced, such as the *great organ*, the chief and most sonorous of all; the *swell-organ*, so called because shut up in a tight box one side of which consists of shutters which may be opened or shut so as to let out or muffle the sound; the *choir-organ*, specially intended for accompanying either voices or other stops of the organ itself; the *solo-organ*, providing stops of very conspicuous power and individuality; and the *pedal organ*, including deep-toned stops played from a keyboard for the feet, and supplying the fundamental tones of the harmony. The number, order, power, and quality of the stops placed in these several partial organs vary widely. Each is complete in itself, having its own wind-chest and keyboard, so that it can be used independently of the others; but by means of couplers any pair may be played conjointly from a single keyboard. (See *coupler*.) The *action* includes one keyboard for each partial organ, a stop-knob for each stop, a knob or piston for each coupler, a swell-pedal, combination pedals, etc. Keyboards for the hands are called *manuals*, and those for the feet *pedals*, each being made up of the usual white and black digitals or keys. The manuals usually have a compass of nearly or about five octaves, beginning on the second C below middle C, while the pedals have about half this compass, beginning an octave lower. The manuals are placed above each other in a desk-like case; when there are two, the lower belongs to the great organ, and the upper to the swell-organ; when there are three, the lowest belongs to the choir-organ. The stop knobs, bearing the names of the stops, are placed on both sides of the manuals, and are grouped according to the partial organs to which they belong. When a stop is to be used, its knob is pulled forward, or "drawn." Frequently *combination pedals* or *pistons* are provided, by which several knobs may be drawn or retired at once. Sometimes, also, a *crescendo pedal* is introduced, by which the entire resources of the instrument may be gradually called into action. The keyboards may be combined in various ways by means of couplers. The digitals of the keyboards are connected with the valves in the wind-chests by a complicated series of stickers, squares, rollers, trackers, etc., which are almost entirely made of wood. In large organs the friction of the key-action is so great that a pneumatic or electric action is employed, in which the digitals merely make connections so that compressed air or electricity may do the work. The stop-knobs are connected with the wind-chests by similar systems of levers, rods, squares, etc., which are also often pneumatically or electrically manipulated. When a digital on one of the keyboards is depressed, a valve is opened from the wind-chest belonging to that keyboard, admitting the compressed air to a groove or channel over which stand all the pipes belonging to the digital: only those pipes, however, are sounded that belong to the stops whose stop-knobs happen to be drawn. The opening and closing of the shutters of the *swell-box* is manipulated through a special *swell-pedal*. Various other mechanical accessories are often added, such as the *tremulant*, a device by which an oscillating tension is given to the air in one of the wind-trunks, the *pedal-check*, the *bellows-signal*, etc. The history of organ music until the sixteenth century was coincident with that of vocal music, for which it merely afforded a basis; but since that time it has had a remarkable independent development, particularly in the works of J. S. Bach. The organ has been much used in conjunction with choral music to enhance broad harmonic effects; and lately it has been also applied to the elaborate imitation of orchestral music. It remains the distinctively church instrument, although it is often found in concert-halls and in opera-houses. Formerly the instrument was often spoken of as *a pair of organs*, or simply *organs*.

> His vois was merier than the merye *orgon*
> On masse days that in the chirche goon.
> *Chaucer*, Nun's Priest's Tale, l. 32.

> The cheife Church of this citty is curiously carved within and without, furnished with a *paire of organs*, and a most magnificent font, all of copper.

7. One of the independent groups of stops of which a pipe-organ is made up; a partial organ, such as the *great organ*, the *swell-organ*, etc., described above.—8. A harmonium or reed-organ.—9†. Some other musical instrument, as a pipe or harp.

The rods of Corti are long, narrow, rigid columnar cells, rising from a conical base and arranged in an inner and an outer row; they incline toward each other and interlock by their heads, forming thus the arch of Corti. Adjoining the inner acoustic rods there is a single row, and externally to the outer rods four to six (in man) rows of acoustic hair-cells; these are long columns, inclined with the rods, attached to the basilar membrane, and terminating in a rounded extremity furnished with a curved row of short, stiff, terminal, hair-like filaments. The term *organic*, as applied to any substance, in no way relates to the presence or absence of life. The materials which compose the living body are of course *organic* in the main, but they are equally so after death has occurred—at any rate for a certain time—and some of them continue to be so for an indefinite period after life has departed. Sugar, for example, is an *organic* product; but in itself it is of course dead, and it retains its stability after the organism which produced it has lost all vitality. *H. A. Nicholson.*

The females are incapable of flight, having only rudimentary wings. In the male the body is slender; the proboscis is short; the palpi are short and very hairy, with the third joint shortest; the antennæ are broadly pectinate; the hind tibiæ have two short apical spurs, or four long ones; and the wings are broad, extending beyond the end of the abdomen. 'mountain-copper,' < *ὄρος*, mountain, + *χαλκός*, copper: see *chalcitis*.] The equivalent in English of the Greek *ὀρείχαλκος*, the name of a metallic alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be classed with gold and silver in respect of value. Plato, while often speaking of it, admits that orichalc was no longer to be had in his time; and some (Aristotle, it is said, among them) deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general — even down to the middle ages — a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made, or the locality whence it came.

He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preëxisted with other human souls; that the soul came into the body as a penalty for sin in a preëxistent state; and he believed in a further moral progress and development after the present life, and defended as a probable opinion the restoration and final salvation of all men and of the fallen angels.

The *native* inhabitants of a country are those who were born there, as opposed to immigrants or those foreign-born. *Indigenous* sounds somewhat strange as applied to races, because the actual origination of a race in a given region is rarely asserted or discussed; the word is often used literally of vegetable products *native* to a region, and sometimes metaphorically of feelings *native* to man: as such it is opposed to *exotic*: as, the potato is believed to be *indigenous*, or *native*, to Peru. *Aboriginal* is used of human beings; the *aboriginal* inhabitants of a country are those that are found occupying the country by civilized discoverers: the North American Indians were the *aborigines* or *aboriginal* inhabitants of the country, but are believed to have been preceded by a race not themselves *indigenous*, nor perhaps the *original* occupants of the soil. See *primary*.—**3.** Inventive, creative.

They vary in epoch from a purely Celtic to a Roman-British period.—**Ornaments rubric**, the rubric immediately preceding Morning Prayer in the present English Book of Common Prayer (1662). It directs that "such Ornaments of the Church, and the Ministers thereof, at all times of their Ministrations, shall be retained and be in use, as were in this Church of England, by the Authority of Parliament, in the Second Year of the Reign of King Edward the Sixth." Controversy as to the lawful ritual of the Church of England has centered for many years around the question whether the ornaments rubric is still in force. The decisions of the ecclesiastical and law courts on the subject have varied, and have not succeeded in putting an end to the controversy or in enforcing uniformity of usage. =**Syn.** Embellishment, adornment. The fur is thick and soft, of a glossy dark-brown color. The fact that the animal is oviparous (though not generally credited till 1884) has long been known, and the egg was figured many years ago. The eggs are about ¾ inch long by ½ inch broad, white, with a flexible shell or pod, like a "soft-shelled" hen's egg. See cuts under *duckbill* and *interclavicle*.

2. [*l. c.*] An animal of this genus; a duckbill.

**ornithosaur** (ôr′nith-ọ-sâr), *n.* [< Gr. *ὄρνις* (*ὀρνιθ-*), a bird, + *σαῦρος*, a lizard.] Same as *ornithosaurian*.

The ilium extends far in advance of the acetabulum, and is expansive, widely arching over the pelvic cavity as in birds. The slender prolonged ischia, in some genera, are ornithic in character, and, in *Hypsilophodon* at least, unite in a median ventral symphysis. The pubes in some genera are as slender and elongated as in a typical bird. The tibia has a great cnemial crest and a ridge for the fibula, and its distal end is as in a bird, with a fossa to receive the ascending process of the astragalus. The distal end of the fibula is smaller than the proximal, though not so much reduced as in birds. The astragalus, similar to that of a bird, remained distinct in many genera; but in some, as *Compsognathus*, *Ornithotarsus*, and *Euskelosaurus*, it seems to have ankylosed with the tibia. The genera of *Ornithoscelida* are numerous, ranging throughout the Mesozoic period; the animals are mostly of large size, some of them, as the iguanodon, being among the largest terrestrial animals known. The order is divisible into two suborders, *Dinosauria* and *Compsognatha*.

Over 300 species have been described, from North America, Europe, and Australia. They are among the most profusely and widely distributed shells of the old rocks. They attained greater size than any other fossil of the time, some fragments having been found which indicate a length of 6 feet.

**orthochromatic** (ôr″thọ̄-krọ̄-mat′ik), *a.* [< Gr. ὀρθός, correct, + χρῶμα, color: see *chromatic.*] In *photog.*, correct in the relations or in the rendering of colors—that is, free from the usual photographic fault of exaggerating the deepness of greens, yellows, and reds and the brightness of blues and violets. The epithet notes any process by means of which this end may be attained, or any plate, chemical, etc., used in such a process. Ordinary photographic dry plates in which a trace of such agents as eosin or chlorophyl is incorporated possess the orthochromatic property, which is greatly enhanced if the exposure is made through a transparent screen tinted to correspond with the prevalent color in the scene or picture, as green for a landscape, or yellow for a painting characterized by draperies of that hue. Also expressed by *isochromatic*, an epithet implying equality of exposure to obtain similar results from opposed colors, contrary to the usual photographic experience.

**orthochromatize** (ôr-thọ̄-krō′mạ-tīz), *v. t.*; pret. and pp. *orthochromatized*, ppr. *orthochromatizing.* [< *orthochromat(ic)* + *-ize.*] In *photog.*, to render orthochromatic, as a plate; bring into conformity with the conditions necessary to obtain a correct rendering of color-values.

**orthoclase** (ôr′thọ̄-klāz), *n.* [< Gr. ὀρθός, straight, right, + κλάσις, fracture: see *clastic.*] Common or potash feldspar, a silicate of aluminium and potassium, occurring in monoclinic crystals and also massive. It has two perfect cleavages, at right angles to each other (whence the name). It varies much in color, from white to yellow, red, and green. Adularia, including most moonstone, is a crystallized variety, transparent or nearly so, characteristic especially of the crystalline rocks of the Alps; valencianite, from Valenciana, Mexico, is similar to it. Sanidine is a glassy variety, usually containing more or less soda; it is characteristic of certain igneous rocks, as trachyte, phonolite, etc.; rhyacolite, from Monte Somma, Vesuvius, is similar. Loxoclase is a variety from Hammond, New York, and murchisonite one from Exeter, England, the latter showing golden-yellow reflections on a surface nearly parallel to the orthopinacoid. Orthoclase is an essential constituent of granite and some other crystalline rocks, and often occurs in large masses in granite-veins, and is then quarried and used in making pottery. Much of the potash feldspar called orthoclase is really the related triclinic species microcline. The name *anorthoclase* has been given to some kinds of triclinic feldspar containing considerable potash, which are more closely related to albite than to microcline in optical characters. See *feldspar.* Also called *orthose.*

**orthoclastic** (ôr-thọ̄-klas′tik), *a.* [< Gr. ὀρθός, straight, right, + κλαστός, verbal adj. of κλᾶν, break.] Characterized by cleavages at right angles to one another: said of certain species of the feldspar group, particularly orthoclase; pertaining to such species, or specifically to orthoclase.

**orthocœlic** (ôr-thọ̄-sē′lik), *a.* [< Gr. ὀρθός, straight, + κοιλία, the belly, the intestines.] Arranged in straight or parallel folds: applied to the intestines of birds when they are thus disposed, in distinction from *cyclocœlic.*

**II.** *a.* Pertaining to or in the direction of the orthodiagonal.

**orthodomatic** (ôr″thọ̄-dọ̄-mat′ik), *a.* [< *orthodome* + *-atic*2.] Pertaining to or in the direction of an orthodome.

It is properly a hemidome, since a given form includes but two planes. See *dome*1, 5.

**orthodox** (ôr′thọ̄-doks), *a.* [= F. *orthodoxe* = Sp. *ortodoxo* = Pg. *orthodoxo* = It. *ortodosso*, < LL. *orthodoxus*, < LGr. ὀρθόδοξος, having a right opinion, < Gr. ὀρθός, straight, right, correct, + δόξα, opinion: see *dogma*, *doxology.*] 1. Holding what is regarded as the correct opinion, or correct opinions, especially in regard to religious or theological doctrines; sound in opinion or doctrine; specifically, conforming to the faith of the Church Catholic, as represented in its primitive ecumenical creeds: applied to persons or doctrines. That which seems to one part of the Christian church orthodox may be held by another to be heterodox. Thus, the Roman Catholic Church regards Protestant churches as heterodox: again, the Reformed churches sometimes deny the title *orthodox* to one another; and generally those who hold to the Trinitarian faith deny the epithet *orthodox* to the Unitarians and Universalists. Orthodoxy is not usually denied to those who are charged with having added articles to the ecumenical faith of Christendom, but only to those who are charged with denying a part of that faith. Thus, the Roman Catholic is not ordinarily refused by Protestants the right to the epithet *orthodox*; nor are Trinitarians denied the right to that epithet by those of Unitarian belief. *Orthodox* is the common epithet of the Greek Church (of which the full official title is 'the Holy Orthodox Catholic Apostolic Oriental Church'), as *Catholic* is of the Roman Church. [The word is employed locally in New England to designate the Trinitarian Congregational churches as distinguished from those of the same order which hold the Unitarian or Universalist faith, as in the phrase "the *Orthodox* Church." It is also used to distinguish the Trinitarian Quakers from those whose belief is or tends toward Unitarianism.]

'Tis the *Orthodox* Tenet, that there never was any remission of Sins but by the blood of the Lamb that was slain from the beginning of the World.
*Milton*, Ans. to Salmasius, Works, III. 182.

*E. A. Freeman*, Venice, p. 198.

**Orthodox school**, in *polit. econ.* See *political.* = **Syn.** 1. *Orthodox, Evangelical.* (See the definitions of these terms.) It is natural for all who care about their doctrinal beliefs to claim the titles that indicate correctness of belief. Hence *orthodox* is a part of the name of the Greek Church; to the Roman Catholic *orthodox* means faithful to the tenets of the Roman Church; in the doctrinal contests of America *orthodox* has generally meant Calvinistic, especially as opposed to Unitarianism and Universalism; in England it has as generally meant High-church, as opposed to Low-church or *evangelical.* *Evangelical*, meaning in harmony with the Gospel, has been claimed somewhat similarly and for a like reason, but has been especially applied to those who emphasize the doctrine of salvation by faith in Christ alone.

The facial angles that have been chiefly used in the definition of these terms are known as Camper's, Geoffroy Saint-Hilaire and Cuvier's, Jacquart's, and Cloquet's (which see, under *craniometry*). A more recent facial angle is that included between the nasio-alveolar line and a line drawn through the supra-auricular point and the inferior margin of the orbit; when this is between 83° and 90°, the skull is said to be orthognathous. The same character is also defined by means of the gnathic or alveolar index, those skulls with a gnathic index below 98 being orthognathous; between 98 and 103, mesognathous; and above 103, prognathous.

**Orthoptera** (ôr-thop'tẹ-rạ̈), *n. pl.* [NL. (Latreille, 1806) (F. *Orthoptères*, Olivier, 1789), neut. pl. of *orthopterus*, straight-winged: see *orthopterous*.] An order of the class *Insecta* proposed by Olivier in 1789 for certain straight-winged insects which Linnæus had placed in *Hemiptera*, and to which De Geer in 1773 had restricted the order *Hemiptera*, placing the true bugs in a new order *Dermaptera*. The order as now understood contains insects in which metamorphosis is incomplete and wings are almost always present, of which the hinder pair are dilated, folded from the base, and of membranous texture, while the fore pair are more or less coriaceous, usually narrow and straight (but variable in this respect), and thickly veined. These insects are active and capable of feeding in all stages from birth to death. Seven families—or, as some consider, tribes or superfamilies—are now recognized. These are the *Blattidæ*, or cockroaches; *Mantidæ*, or praying-insects; *Phasmidæ*, or walking-sticks; *Gryllidæ*, or crickets; *Locustidæ*, or long-horned grasshoppers or katydids; and *Acrididæ*, or short-horned grasshoppers or true locusts, including the migratory species. (See *locust* for an explanation of the fact that the *Locustidæ* are not locusts.) The *Orthoptera* are in the main herbivorous, but the *Mantidæ* are carnivorous, and some of the *Blattidæ* are omnivorous. They are found all over the world, but most numerously in the tropics, where among them are the largest known representatives of the whole insect class. All the known species are terrestrial or arboreal, no aquatic forms having been discovered; and according to their habitual mode of progression the families have been grouped by Westwood as *Cursoria*, *Raptoria*, *Ambulatoria*, and *Saltatoria*. The *Orthoptera* are among the earliest forms of insect life to appear in geologic time, and the *Blattidæ* in particular are very numerous in some geological formations. The main characters used in classifying the *Orthoptera* are derived from the modifications of the genitals, mouth-parts, and antennæ. These words, as well as *oryktographie*, were somewhat extensively used by Continental geologists, in the early part of the nineteenth century, with a meaning nearly equivalent to what is now comprehended under the terms *mineralogy* and *lithology*; and this also included more or less, according to the usage of various authors, of economical and mining or "applied" geology. The terms corresponding to *oryctography* and *oryctognosy* have been dropped from the Continental languages for fully fifty years, and the use of the words in English became correspondingly rare. **osculate** (os'kụ-lāt), *v.*; pret. and pp. *osculated*, ppr. *osculating*. [< L. *osculatus*, pp. of *osculari*, kiss, < *osculum*, a little mouth, a pretty mouth, a kiss, dim. of *os*, a mouth: see *os*$^2$, *oral*, etc.] **I.** *trans.* 1. To salute with a kiss; kiss. *Imp. Dict.*—2. In *geom.*, to have a higher contact with; touch as closely as possible. Thus, a plane or a circle is said to *osculate* a curve when it has three coincident points in common with the curve—that is, it occupies such a position (and in the case of the circle has such a size) that as it is brought up into this position three points of intersection with the curve run into one. A sphere is said to *osculate* a tortuous curve when it has four coincident points in common with the curve. In these cases, to *osculate* means to have the greatest number of coincident and successive points common to a fixed locus which is compatible with the general character of the locus which osculates; and some geometers restrict the word to this meaning. This meaning is also extended to time: thus, the *osculating* elements of a planet are those elliptic elements which would satisfy three exact observations made at times infinitely little removed from a given epoch. But *osculate* is also used loosely to mean merely that the loci in question have three or more coincident points in common. A tangent-line or -plane is never said to *osculate* a curve or surface unless it has more than ordinary contact with it.

**II.** *intrans.* 1. To kiss one another; kiss. *Imp. Dict.*—2. In *geom.*, to have, as two loci, three or more coincident and successive points in common. See I., 2.—3. He is son of Seb and Nut, or Heaven and Earth. His antagonist is Set, the deity of evil or darkness, by whom he is slain; but he is avenged by Horus, and reigns in the lower world. With him was formally identified every departed soul in its nether abode, to be protected by him in the necessary conflict with the genius of evil. The worship of Osiris was extended, at about the beginning of the Christian era, over Asia Minor, Greece, and Rome. In art Osiris is usually represented as a mummy, wearing the crown of Upper Egypt, often flanked by ostrich-plumes. The accompanying cut represents a bronze figurine in the Metropolitan Museum of Art, New York.

It does not occur native, but has been found to constitute a part of the native platina of all the platiniferous regions (South America, California, Australia, Russia), in the form of iridosmium, an alloy of the metals osmium and iridium. The specific gravity of the artificially obtained metal has been found to be 22.477; hence it is the heaviest of those bodies. It has never been fused. Its crystalline form is either that of the cube or that of a very obtuse rhombohedron. The crystals are of a bluish-white color, with a violet luster, and are harder than glass. Osmium is not used in the arts, except in the form of iridosmium, of which material the tips of gold pens are made.

It is a kind of diffusion (see *diffusion*), and includes *endosmosis* and *exosmosis*—the former being distinguished either as the tendency of the outer fluid to pass through into the inner, or as the action of that fluid which passes with the greater rapidity into the other. When two saline solutions differing in strength and composition are separated by a porous diaphragm or septum of bladder, parchment-paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidities, so that after a time the height of the liquid is not the same on both sides. These phenomena are explained by the unequal molecular attraction exerted between the capillary apertures in the porous diaphragm and the different liquids experimented upon.

**osmosis** (os-mō′sis), *n.* [NL.: see *osmose*, and cf. *endosmosis*, *exosmosis*.] The diffusion of fluids through membranes. See *osmose*.

There is probably but one species, *Pandion haliaetus*, of almost world-wide distribution, running into several geographical races or varieties which have been specifically named. It is a large hawk, nearly or quite 2 feet long, and 4½ feet in extent of wings, of a dark Vandyke brown above, the feathers more or less laced with white, the head, neck, and under parts white, with blackish streaks on the crown, a blackish postocular stripe on the nape, and the breast more or less covered with dusky spots. The coloration varies much in the relative amounts of light and dark colors, and the young are darker than the old birds. The feet are very large and roughly granulated, and the talons are all of great size; the outer toe is versatile. The osprey builds a bulky nest in a tree, on a rock, or on the ground, and the nests sometimes acquire enormous dimensions from yearly repairs and additions. The eggs, two or three in number, average about 2.5 by 1.75 inches in size, and are usually heavily marked with various shades of browns and reds. The fish-hawk, as its name implies, feeds on fish, which it catches by plunging from on the wing. Also called *fishing-hawk*, *fishing-eagle*.

The word is much the least often used of the four. *Specious* is superficially fair, just, or correct, appearing well at first view but easily proved unsound. *Plausible* is applied to that which pleases the ear or the superficial judgment, but will not bear severe examination. *Ostensible* reasons; *colorable* claims; *specious* means; *plausible* explanations.

It is characterized by a large, hard, and often calcified bivalve shell, or hinged shell-like valves, consisting of two unequal lateral parts of an unsymmetrical carapace, movably joined together and often peculiarly ornamented; a rudimentary abdomen; a very small shell-gland; the body not ringed, ending in a bifid tail; very few thoracic appendages (generally two or three), not foliaceous, but cylindroid, like the legs of higher crustaceans; branchiæ attached to the oral appendages; eyes, when present, median and coalesced or lateral and separate; and antennules and antennæ large and subserving locomotion. The *Ostracopoda* are mostly minute fresh-water crustaceans, swimming very actively by means of their antennæ; some carry their eggs about with them like ordinary *Crustacea*, but most attach them to foreign substances, as aquatic plants. These crustaceans are common in all geologic strata from the earlier Paleozoic formations, and appear to have undergone little modification. There are several families and a number of genera, such as *Cypris* and *Cythere*. Also called *Ostracoda* and *Ostrapoda*. See cuts under *Cypris* and *Cythereidæ*.

**Ostreidæ** (os-trē′i-dē), *n. pl.* [NL., < *Ostrea* + *-idæ*.] A family of monomyarian bivalve mollusks, the oysters, typified by the genus *Ostrea*, to which various limits have been assigned. (*a*) In Woodward's and older systems, a large group including all forms with the mantle quite open, a very small foot or none, an inequivalve shell, free or adherent to foreign bodies, resting on one valve, with central beaks, internal ligament, single adductor muscle, and obscure pallial line. Thus it included not only the *Ostreidæ* proper, but also *Anomiidæ*, *Placunidæ*, *Pectinidæ*, *Limidæ*, and *Spondylidæ*. (*b*) Now restricted to oysters which have the mantle-margin double and finely fringed, nearly equal gills united to one another behind, and the mantle-lobes forming a complete branchial chamber. The shell is irregular, being both inequivalve and inequilateral, attached by the left valve, and the ligament-cavity is triangular or elongated. In structure the shell is subnacreous, and laminated with prismatic cellular substance. Thus limited, the *Ostreidæ* contain only the oysters and closely related bivalves, of which there are many species, extinct and extant. Pearl-oysters belong to a different though related family, *Aviculidæ*.

**ostreiform** (os′trẹ̄-i-fôrm), *a.* [< L. *ostrea*, an oyster, + *forma*, form.] Oyster-like; resembling an oyster in form; ostraceous.

'camel-bird,' so called with ref. to its long neck, < στρουθός, a bird, esp. a sparrow; cf. ὁ μέγας στρουθός, lit. 'the great bird,' στρουθός κατάγαιος, 'ground-bird,' στρουθός χερσαῖος, 'land-bird,' στρουθός Λιβυκός, 'Libyan bird,' στρουθός 'Αράβιος, 'Arabian bird,' or simply στρουθός, all applied to the ostrich. From the LL. *struthio* are also AS. *strūta* = OHG. MHG. *strūz*, G. *strausz*; also, after MHG., MLG. *strūs* = D. *struis* = Sw. *struts* = Dan. *struds*; also It. *struzzo*, dim. *struzzolo*, = OF. *strucion* (> ML. reflex *strucio*(*n-*) and ME. *strucioun*), ostrich.] A very large ratite bird of the genus *Struthio*. The true or African ostrich (*S. camelus*) inhabits the sandy plains of Africa and Arabia, and is the largest of all existing birds, attaining a height of from 6 to 8 feet. The head and neck are nearly naked, and the quill-feathers of the wings and tail have their barbs wholly disconnected. It is chiefly for these plumes, which are highly esteemed as articles of dress and decoration, that the bird is hunted and also reared in domestication. The legs are extremely strong, the thighs are naked, and the tarsi are covered with scales. There are only two toes, the first and second being wanting. The pubic bones are united — a conformation occurring in no other bird. The wings are of small size and incapable of being used as organs of flight; the birds can run with extraordinary speed, distancing the fleetest horse. The food consists of grass, grain, and other substances of a vegetable nature. Ostriches are polygamous, every male consorting with several females, and they generally keep together in larger or smaller flocks. The eggs are of great size, averaging three pounds each in weight, and several hens often lay in the same nest, which is merely a hole scraped in the sand. The eggs appear to be hatched mainly by incubation, both parents relieving each other in the task, but also partly by the heat of the sun. The South African ostrich is often considered as a distinct species under the name of *S. australis*. Three South American birds of the genus *Rhea* are popularly known as the *American ostrich*, though they are not very closely allied to the true ostrich, differing in having three-toed feet and in many other respects. The best-known of the three is *R. americana*, the *nandu* or *nanduguaçu* of the Brazilians, inhabiting the great American pampas south of the equator. It is considerably smaller than the true ostrich, and its plumage is much inferior. *R. darwini*, a native of Patagonia, is still smaller, and belongs to a different subgenus (*Ptilocnemis*). The third species is the *R. macrorhyncha*, so called from its long bill; it is perhaps only a variety of the first.

Among some common fishes the otolith decreases in size in the following order: cod, hake, haddock, whiting, conger, turbot, sole, gurnard, smelt, and trout. The concretions differ much in shape. In the conger the otolith is shaped like a sole, 1½ inches long, ⅜ inch wide, and is thin and glassy. In the cod it is of the size of a horse-bean, and is curved on itself. The ear-stones of the American sheepshead are shaped like a tamarind-seed, and look like pieces of milky quartz. They are often carried in the pocket as "lucky stones."

It is occasionally also prefixed below a note or passage to be performed an octave lower than it is written. The former effect is also indicated by *ottava alta*, and the latter by *ottava bassa*. In either case the intention is simply to avoid the excessive use of leger or added lines.

There are several genera, as *Barangia* (or *Leptonyx*), *Aonyx*, *Lontra* (or *Saricovia*), *Lutra* proper, *Hydrogale*, and *Pteronura*. They all have large flattish heads, short ears, webbed toes, crooked nails, and tails slightly flattened horizontally. The common river-otter, the *Lutra vulgaris* of Europe, is a quadruped adapted to amphibious habits by its short, strong, flexible, palmated feet, which serve as oars to propel it through the water, and by its long and strong tail, which acts as a powerful rudder, and enables the animal to change its course with great ease and rapidity. It inhabits the banks of rivers, and feeds principally on fish. When its retreat is found, the otter instantly takes the water and dives, remaining a long time underneath it, and rising at a considerable distance from the place where it dived. The weight of a full-grown male is from 20 to 24 pounds, and its length is about 2 feet exclusive of the tail. In many parts of England, and especially in Wales, the otter is hunted with dogs trained for this purpose. The other species of *Lutra* proper, which are found in different parts of the world, do not differ greatly from the European otter. The American otter is a quite distinct species, *Lutra* (*Latax*) *canadensis*. Some Asiatic otters with reduced claws constitute the genus *Aonyx*. There are South American otters, as *Lutra brasiliensis* and *L. chilensis*. The most remarkable form is the winged-tailed or margin-tailed otter of South America, *Pteronura sandbachi*. The fur of otters is valuable. One kind of it, from South America, is known as *nutria*.

**ourselves** (our-selvz'), *pron. pl.* [< *our* + *selves*.] We or us, not others: often, when used as a nominative, added to *we* by way of emphasis; when in the objective, often without emphasis and simply serving as the reflexive pronoun corresponding to *us:* as, we blame *ourselves;* we pledge *ourselves*.

Not that we are sufficient of *ourselves* to think any thing as of *ourselves;* but our sufficiency is of God. 2 Cor. iii. 5.

**-ous.** [ME. *-ous*, *-ouse;* < OF. *-ous*, *-os*, *-us*, *-eus*, later *-eux*, F. *-eux* = Sp. Pg. It. *-oso*, < L. *-ōsus*, for **-onsus*, orig. (Aryan) **-wansa*, **-wanta*, a suffix (equivalent to E. *-ful* or *-y*$^{1}$ or *-ed*$^{2}$) attached to nouns to form adjectives noting fullness, as in *callosus*, hard-skinned, callous, *famosus*, noted, famous, *generosus*, well-born, generous, *odiosus*, hateful, odious, *religiosus*, scrupulous, religious, *sumptuosus*, costly, sumptuous, *vitiosus*, faulty, vicious, etc.] A suffix of Latin origin, forming, from nouns, adjectives denoting fullness or abundance, or sometimes merely the presence, of the thing or quality expressed by the noun, as in *callous*, *famous*, *generous*, *odious*, *religious*, *sumptuous*, *vicious*, etc. (see etymology). Many modern English adjectives taken directly from the Latin have *-ose*, as *jocose*, *verbose*, with or without an equivalent form in *-ous*, as *herbose herbous*, *onerose onerous*, *vinose vinous*, *spicous spicose*, etc., the form in *-ose* being especially common in botanical terms. By reason of the agreement in the terminal pronunciation of English adjectives in *-ous* and the English pronunciation of Latin adjectives in *-us* (in Latin a mere nominative termination), many such adjectives in *-us* have been transferred into English with the accommodated termination *-ous*, as *anxious*, *conspicuous*, *devious*, *obvious*, *previous*, *serious*, etc., from Latin *anxius*, *conspicuus*, *devius*, *obvius*, *prævius*, *serius*, etc. So with Latin or New Latin adjectives in *-us* from Greek *-ος*, as in *acephalous*, etc. The suffix *-ous* is felt as an English formative only when a noun accompanies the adjective, as in *famous*, *odious*, *religious*, *ambitious*, etc., associated with the nouns *fame*, *odium*, *religion*, *ambition*, etc. It is sometimes used (as also *-ose*), as an English formative, attached to words of non-Latin origin, as in *quartzous* or *quartzose*, etc.

The outcrops of the stratified formations depend on the amount of inclination of the beds. When these lie quite horizontal, there can be no outcropping edges of the strata, except when the formation has been cut into by erosion. That part of a female animal in which ova, eggs, or germs are generated and matured; the essential female organ of reproduction, corresponding to the testes of the male; the female genital gland or germ-gland; the ovarium. In vertebrates the ovary is a glandular organ, usually paired, sometimes single, and morphologically identical with the testes, both these organs being developed from a primitively indifferent genital gland common to both sexes, the differentiation of this structure into ovary or testes being the fundamental distinction of sex upon which all other sexual differences are consequent. The ovary consists of its proper stroma or tissue peculiar to itself, in which the ova are produced, bound up in ordinary connective tissue, supplied with appropriate vessels or nerves, and fixed in the abdominal cavity by means of a mesentery. With the ovary is usually but not always associated a special structure, the *oviduct*, serving to convey away the eggs. The ovary is relatively largest in those animals which lay multitudinous eggs, as fishes, in which it is known as the *roe*. It is also large in oviparous animals which lay large meroblastic eggs with copious food-yolks, as birds and most reptiles. It is very small in mammals. The ovary in woman is a flattened ovoid body about 1½ inches long, ¾ inch wide, and ⅓ inch thick, resting on the broad ligament of the uterus and closely connected both with that organ and with the Fallopian tube or oviduct. Among invertebrates in which there is distinction of sex, the name *ovary* is applied to any part of the body which can be recognized as having the function of ovulation. Such organs are of almost endlessly varied character in all but the one essential physiological respect. Several kinds of ovaries receive specific names; and in many cases the analogy to the part of a plant called the ovary (see def. 2) is striking. See cuts under *Dibranchiata* and *Nematoidea*.

2. In *bot.*, a closed case or receptacle, the lower section of the pistil, inclosing the ovules or young seeds, and ultimately becoming the fruit. Structurally the ovary is a modified leaf which is folded involutely so as to form a cavity, and with the style and stigma it constitutes the female sexual organs (gynœcium) of flowering plants. The ovary may be simple (that is, composed of a single leaf), or compounded of two or more leaves. The modified part of the interior of the ovary which bears the ovules is called the *placenta* (which see). The phrases *superior* and *inferior ovary* are used to designate the position of the ovary in relation to that of the floral envelops: thus, *ovary superior* is that in which the other parts of the flower are inserted upon the axis below the ovary; *ovary inferior* is that in which the other parts of the flower are inserted above, seemingly upon the ovary. See cuts under *anthophore*, *Araceæ*, *Didynamia*, *dimerous*, and *myrtle*.

Skt. *ukhā*, a pot; AS. *ofnet*, a closed vessel.] 1. A chamber or receptacle in which food is cooked by the heat radiated from the walls, roof, or floor. (*a*) A chamber built of brick, tiles, or the like, and usually heated by fuel which is allowed to burn away before the food is introduced, the cooking being done by the heat retained. (*b*) A chamber for baking or cooking in a cooking-stove, range, or furnace, the heat being usually transmitted through one or more of the sides.

> In steed of bread they drie a kind of fish which they beat in mortars to powder, and bake it in their *ouens*, vntill it be hard and drie.
> *Holinshed*, Descrip. of Britain, I. x.

2. In general, any inclosed chamber adapted to or used for applying heat to raw materials or to articles in process of manufacture. The heat so applied may be radiated from the previously or continuously heated walls of the inclosure, or it may be derived from currents of heated air or gases or superheated vapors circulated through the oven, from interior or exterior coils of pipes heated by steam or hot water, or from the solar rays. The name *oven* is given to a great variety of structures and devices employed in domestic industry, in chemical operations, and in the mechanical arts. Specifically—(*a*) A kiln. (*b*) A muffle-furnace. (*c*) A leer.

3†. A furnace.

> The king's servants, that put them in, ceased not to make the *oven* hot with rosin, pitch, tow, and small wood; so that the flame streamed forth above the furnace forty and nine cubits.
> *Song of the Three Holy Children* (Apocrypha), v. 23.

4. An oven-bird or its nest.—**Air-oven**, an oven in which baking or drying is done by circulating heated air through it. It is much used in laboratories and in the arts. In some cases, as in drying gelatin plates for photography, the air is filtered on its way to the oven by passing it through cotton-wool. In air-ovens the air may be heated prior to its admission, or by interior heating appliances.—**Annealing-oven**, an oven used for annealing, as the leer of glass-manufactories for slowly cooling glass, which, if cooled rapidly, would be exceedingly brittle; or, as in the manufacture of malleable iron-castings, the inclosure in which the articles, after casting, are treated to render them malleable.—**Bakers' oven**, an oven used by bakers in baking bread, biscuits, crackers, and other articles of food. The principal oven still in use by bakers is a brick reverberatory oven with an arched roof; but in the manufacture of biscuits, crackers, wafers, etc., on a large scale reel ovens and rotary ovens are used.—**Beehive oven.** See *beehive*.—**Brick oven**, an oven constructed of brick, in contradistinction to an oven made of metal or other material. Brick ovens usually apply their heat from their walls previously heated by an interior fire, which is withdrawn prior to putting in the article to be baked. Such an oven for domestic use was once very common in dwellings, and was generally built at the side of or in close proximity to the chimney then in use. It often projected from the exterior of the building, and this construction is still to be seen in many old country houses. It has a smoke-uptake in the upper part of the mouth and a flue leading from the uptake, and connects at its upper end with the fireplace-chimney. Wood is the fuel used, and when the fire is kindled the air draws into the mouth and passes over the bottom of the oven, while the heated gases of combustion rise to the top and pass forward to the uptake.—**Bush-oven**, the long-tailed titmouse or oven-bird, *Acredula rosea*. [Norfolk, Eng.]—**Drying-oven**, an oven used for expelling moisture from substances or textures. The air-oven is the most generally used of this class. Drying-ovens heated to a point somewhat above the boiling-point of water, which expel water by converting it into steam, are also used for many purposes.—**Dutch oven**, a tin utensil for roasting meat, etc., closed at the sides, back, top, and bottom, and somewhat resembling in shape an open shed. The oven covers the joint or other article to be roasted on all sides except that facing the fire. (Also called *kitchen* or *tin kitchen* in the New England States and elsewhere.) The bake-kettle, a cast-iron vessel with a close-fitting convex cover upon which hot embers or coals are placed when the implement is used, is also sometimes called a *Dutch oven*.—**Egyptian oven**, a large earthen crock sunk in the ground, and heated by interior fire, which is removed to permit the baking of lumps of dough. These are thrown with force against the interior, and adhere thereto. The crock is then covered till the baking is finished. This is a very ancient form of oven, largely used in the East even to the present day.—**Elevated oven**, a range-oven situated higher than the fire-pot.—**Heating-oven**, an oven designed or used for simple heating, as in heating pieces of wood or other materials to be joined by glue or cement, or for heating vessels that must be used while hot; a hot-closet.—**Out-oven**, a domestic brick oven built by itself, apart from any building. Its construction is almost identical with that described under *brick oven*, except that it has a chimney extending straight upward over the mouth of the oven.—**Reel oven**, an oven in which the substances to be baked or dried are placed on swinging shelves attached to endless chains running on reels within a heated inclosure. The reels are turned at a velocity that permits the articles to be dried sufficiently, or baked completely, when the chain makes a complete circuit, which brings one of the swinging shelves on a level with the door of the oven. The finished articles are then removed from this shelf, and a new charge is put in their place. This discharging and recharging is successively performed for each shelf. Generally, ovens of this kind and rotary ovens are continuously heated by circulation of heated air through them, or by heated air through their walls, or by highly heated steam-coils.—**Revolving oven**, an oven in which the floor, or the shelves supporting the articles to be baked, etc., revolve horizontally or vertically. The articles are completely dried or baked in a single revolution, and are successively removed and replaced by new charges, as described under *reel oven*, which is an example of this kind of oven. In some ovens of this class a shaft with radial arms carrying swinging shelves rotates vertically in the heated inclosure. The manipulation and heating are as described under *reel oven*.—**Rotary-hearth oven**, an oven in which the floor or hearth revolves.—**Rotary oven**, an oven which can be horizontally rotated as a whole on a central pivot. Such ovens were formerly used with a form of kitchen stove called *rotary stove*. They were portable tin ovens made to fit the tops of the stoves, which were circular, and constructed to rotate on a central pivot. The top of the stove was toothed on the under side of its outer margin. The teeth were engaged by a small pinion operated by a crank. The articles to be baked were placed on the top of the stove, and covered with the portable tin oven, and, to prevent overheating of any part, the top of the stove was frequently turned to change the position of the parts relatively to the fire-pot.—**Traveling-apron oven**, an oven in which an endless belt traverses horizontally, carrying the articles to be baked from end to end of the oven. (See also *coke-oven*, *porcelain-oven*, *roasting-oven*, and *tile-oven*.)

**oven-bird** (uv'n-bėrd), *n.* 1. The golden-crowned thrush, *Siurus auricapillus*, an oscine passerine bird of the family *Mniotiltidæ*: so called from the fact that its nest is arched or roofed over like an oven. [Local, U. S.]—2. Any bird of the South American family *Furnariidæ*, which builds a domed or oven-like nest. See cut under *Furnarius*.—3. The long-tailed titmouse, *Acredula rosea*. [Prov. Eng.]—4. Its form varies from a brief flourish to a medley of melodies or themes extracted from the body of the work, or to a composition of independent form complete in itself. In some cases overtures are divided into two or more sections or movements, resembling those of a suite or a symphony, each modeled upon some dance form, the sonata form, the fugue form, etc.; but they are more frequently in a single continuous movement. Many veritable overtures being successfully used as concert pieces, it is now customary to give the name to detached works for orchestra which are intended simply for concert use, though in such cases a special title is usually given to the composition.

**5.** Something offered to open the way to some conclusion; something proposed for acceptance or rejection; a proposal: as, to make *overtures* of peace.

An overture may proceed either from an inferior court or from one or more members of the court to which it is presented. In the General Assembly of the Church of Scotland (as in the supreme courts of most Presbyterian churches) legislative action is initiated by adopting an overture and sending it to presbyteries for their consideration. See the quotation.

Before the General Assembly passes any Acts which are to be binding rules and constitutions to the Church, . . . the same must be first proposed as an *overture* to the Assembly, and, being passed by them as such, be remitted to the consideration of the several Presbyteries of this Church, and their opinions and consent reported to the next General Assembly. . . . If returns . . . show that a majority of the Presbyteries approve, the *overture* as sent down may then be passed, and most frequently is passed, into an Act by the Assembly.

That which is *overturned* or *overthrown* is brought down from a standing or erect position to lie prostrate. *Overthrow* indicates more violence or energy than *overturn*, as *throw* is stronger than *turn*. That which is *subverted* is reached to the very bottom and goes to wreck in the turning: as, to *subvert* the very foundations of justice. An oviduct exists in most vertebrates, and is usually paired, there being one to each ovary, but often single, the duct of one or the other side remaining undeveloped, as in birds. When well formed, as in birds and other animals which lay large eggs to be hatched outside the body, the oviduct is a musculomembranous tube or canal, of which one end is in relation with or applied to the ovary, and the other debouches in the cloaca, the tube being held in place by a special mesentery or mesometrium. In the course of the oviduct its mucous membrane acquires special characteristics, and secretes different substances; so that the ovum, escaping from the ovary as a ball of yellow yolk, becomes successively coated with white albumen, with a soft egg-pod, and finally, as in birds, with a hard chalky shell. The oviducts of the lowest mammals, which are oviparous, are of similar character; but in most mammals the pair of oviducts coalesce in the greater part of their length, whence result a single vagina and womb, with a pair of Fallopian tubes or oviducts in a restricted sense. A womb or uterus is simply a specialized part of an oviduct, where the ovum is detained long enough to be developed into a fetus and born alive. The oviducts of invertebrates, where any exist, are as diverse in character as the ovaries. See *ovary*$^1$, and cuts under *Dendrocœla*, *Dibranchiata*, *Epizoa*, and *germarium*.

**oviferous** (ọ-vif'e-rus), *a.* [< L. *ovum*, an egg, + *ferre* = E. *bear*$^1$.] Bearing eggs; ovigerous: specifically applied to certain receptacles into which ova are taken upon their escape from the ovary, as in some crustaceans.

It normally or usually consists of three pairs of rhabdites, the outer two pairs of which incase or sheathe the inner pair, and form an extensile tube, of very variable size and shape in different insects. It is sometimes longer than the body of the insect. In the terebrant hymenopters the ovipositor forms a saw or an auger (serra or terebra). In the aculeate hymenopters, as bees and wasps, the ovipositor is the sting or aculeus. In orthopters it is often conspicuous, as seen in the cut. Also called *oviscapt*. Ovoviviparous animals are intermediate in this respect between oviparous and viviparous ones, whence the name. The process is a kind of internal incubation, but not a true gestation or pregnancy. It occurs in some fishes, many reptiles, some insects, as flesh-flies, various worms, and a great many other invertebrates. The carrying of eggs in any special receptacle about the body, from the time they leave the ovary until they hatch, also constitutes ovoviviparity. The implacental mammals, as marsupials, whose young are born very imperfect and then placed in a pouch, are sometimes called ovoviviparous.

**ovulation** (ō-vụ-lā'shọn), *n.* [< *ovulate*, *v.*, + *-ion*.] The formation or production of ova or ovules; also, a discharge of an ovum from the ovary. In women ovulation normally recurs thirteen times a year during the sexual life of the individual, and is accompanied by the phenomena of menstruation.

**ovule** (ō'vūl), *n.* [< F. *ovule*, < ML. *ovulum*, a little egg (NL. an ovule), dim. of L. *ovum*, egg: see *ovum*.] **1.** A little egg; specifically, in *anat.*, *physiol.*, and *zoöl.*, an ovulum or ovum, especially a small one, as that of a mammal, or one not yet matured and discharged from the ovary: specifically applied by Haeckel to the ovum or fertilizable but unfertilized egg-cell of the female, conformable with the use of *spermule* for the male sperm-cell. Its protoplasm is termed by him *ovoplasm*, and its nucleus *ovococcus*.—**2.** In *bot.*, a young or rudimentary seed; a peculiar outgrowth or production of the carpel which, upon fertilization and the formation of an embryo within, becomes the seed. In the angiospermous gynœcium the ovules are normally produced along the margins, or some part of the margins, of the carpellary leaf, either immediately or by the intermediation of a placenta, which is a more or less evident development of the leaf-margins for the support of the ovules. Rarely ovules are developed from the whole internal surface of the ovary, or from various parts of it, in no definite order, directly from the walls, and without the intervention of anything which can be regarded as a placenta. In gymnosperms the ovules are borne on the face of the carpellary scale or at its base; or on metamorphosed leaf-margins, as in *Cycas*; or, when there is no representative of the carpel, on the cauline axis, seemingly as a direct growth of it. (*Gray.*) The only essential part of the ovule is its *nucleus*, or *nucellus*, as it has been termed recently, which is usually invested by one or two coats, the *primine* and *secundine*. The coats are sacs with a narrow orifice called the *foramen*, the closed vestige of which becomes the *micropyle* in the seed. The proper base of the ovule is the *chalaza*, and it may be either sessile or on a stalk (funiculus) of its own. The *hilum* is the scar left when the seed is detached from its funiculus. As to shape, ovules may be orthotropous, campylotropous, amphitropous, or anatropous; and as to position in the ovary, they may be erect, ascending, horizontal, pendulous, or suspended. In regard to numbers, they may be solitary, few, or indefinitely numerous. See cuts under *accumbent*, *anatropous*, *funicle*, *magnolia*, *orthotropous*, and *ovary*.

The shell is elongated, the ends of the lips being drawn out in some cases to such length that the resulting figure resembles a weaver's shuttle. Also rarely called *Amphiperatidæ*. Also *Ovulinæ*, as a subfamily of *Cypræidæ*. See cut under *ovulum*.

Egg-shell (*Ovulum ovum*).

**ovum** (ō'vum), *n.*; pl. *ova* (ō'vạ̈). [L., = Gr. ᾠόν, an egg: see *egg*$^{1}$.] 1. An egg, in a broad biological sense; the proper product of an ovary; the female germ or seed, which when fertilized by the male sperm, and sometimes without such fecundation, is capable of developing into an individual like the parent. There is a great similarity in the ova of different animals throughout the metazoic series, from the sponge to the human being, no ova in their early stages being distinguishable from one another in their essential characters. All true ova, as distinguished from spores and products of fission or gemmation, are referable to the single morphological type of the *cell;* and they are furthermore indistinguishable from unicellular animals, and from many of the cells composing the bodies of the higher animals. An ovum consists of a quantity of protoplasm or cell-substance called the *vitellus* or *yolk*, inclosed in a cell-wall or vitelline membrane, and provided with a nucleus and usually a nucleolus; it is engendered in the ovarium, usually in an ovisac or so-called Graafian follicle, is discharged from its matrix, usually then meeting with the male element, and proceeds to develop within or without the body of the parent. The ovum proper, like most cells, is usually of microscopic size; but its bulk may be enormously increased by the addition of extrinsic or adventitious protoplasmic or albuminous substance, and it may be further protected by various kinds of egg-pod or egg-shell, all without losing its essential character as a cell. The largest ova, relatively and absolutely, are birds' eggs, these being by far the largest cells known in the animal kingdom. Here the quantity of food-yolk which does not undergo transformation into the body of the chick is out of all proportion to the formative yolk proper, which makes only a speck in the great ball of "yellow" and "white." Such ova are called *meroblastic*, in distinction from *holoblastic*. The human ovum is very minute, relatively and absolutely, averaging about $\frac{1}{200}$ of an inch in diameter. It is said to have been first recognized by K. E. von Baer in 1827. The parts of the ovum have been badly named, without reference to its morphology as a cell. Thus, the cell-wall is called the *zona pellucida;* the nucleus is named the *germinal vesicle* or *vesicle of Purkinje*, and its nucleolus the *germinal spot* or *spot of Wagner*. The phrases *germinal vesicle* and *germinal spot* are misleading. The first stages of development of an ovum, consequent upon fertilization, consist in the *segmentation of the vitellus*, or yolk-division, by which the cell-substance becomes a mulberry-mass of spherules, called the *morula*. The rest is an intricate process of differentiation and specialization of these spherules, and their multiplications into the myriads of different kinds of cells of which the whole body of most adult animals is fabricated. Some of the early special stages of this process are known as the *morula, gastrula, blastula*, etc. The first tissue or coherent layer of cells produced is called a *blastoderm*. When there are two layers, inner and outer blastodermic layers, they are distinguished as *endoderm* and *ectoderm;* when a third intermediate layer is formed, it is the *mesoderm*. An ovum is called, in general, a *germ* until the rudiments of its specific characters appear, when it becomes an *embryo*, and later may be a *fetus*. That department of ontology which treats of the development of the ovum is *embryology*. See cuts under *diphyzoöid, gastrulation, gonophore*, and *ovotestis*.

A raptorial nocturnal bird of prey of the family *Strigidæ*. Owls constitute a highly monomorphic group, the suborder *Striges* of the order *Raptores*. With few exceptions, they are of distinctively nocturnal habits and a peculiar physiognomy produced by the great size and breadth of the head and the shortened face with large eyes looking forward and usually set in a facial ruff or disk of modified feathers, which hide the base of the bill. Many owls have also "horns" (that is, ear-tufts) or plumicorns. The bill is hooked, but never toothed, and the nostrils open at the edge of the cere, not in it. The plumage is very soft and blended, without aftershafts, and the flight is noiseless. The talons are large, sharp, and hooked as in other birds of prey; the outer toe is versatile; and the feet are usually feathered to the claws. (See cut under *braccate*.) There are many anatomical characters. (See *Striges*.) Owls are among the most nearly cosmopolitan of birds. They feed entirely upon animal substances, and capture their prey alive, as small quadrupeds and birds, various reptiles, fishes. and insects. They lay from three to six white eggs of subspherical shape. There are about 200 species, assigned to some 50 modern genera, and now usually considered as constituting 2 families, *Aluconidæ* and *Strigidæ*, or barn-owls and other owls. See cuts under *barn-owl*, *Bubo*, *Glaucidium*, *hawk-owl*, *Nyctala*, *Otus*, *snow-owl*, and *Strix*.

> The *owls* are African, English, and Chinese. The African is at home in Tunis, whence many thousands have been sent to England, and of which scarcely dozens remain. The bird is the smallest of the family, and so delicate that its term of life out of African air is very limited. The English *owl* is fair in size, with eye round and prominent, the dewlap well developed, and the frill extending to the lower point of the breast. In the Chinese this frill-feathering is excessive, even extending up about the throat to the eyes. *The Century*, XXXII. 107.

This is the owl well known on the western prairies in connection with the prairie-dogs, in the deserted burrows of which it makes its nest, and on the pampas of South America in similar relations with the viscachas. There is a colony in Florida, and there are several in the West Indies. These owls are diurnal, and feed upon insects and small mammals and reptiles. The several animals of this kind have each of them specific designations, as *buffalo, bison, aurochs, zebu, musk-ox*, etc.: the word is commonly restricted to the varieties of *Bos taurus*, the common ox, which is one of the most valuable of domestic animals. Its flesh is the principal article of animal food, and there is scarcely any part of the animal that is not useful to mankind: the skin, the horns, the bones, the blood, the hair, and the refuse of all these, have their separate uses. Having been specially domesticated by man from a stock which it is probably impossible to trace, the result has been the formation of very many breeds, races, or permanent varieties, some of which are valued for their flesh and hides, some for the richness and abundance of their milk, while others are in great repute for both beef and milk. Among the first class may be mentioned the Durham or shorthorn, the polled Aberdeen or Angus, and the West Highland or kyloe. Among the most celebrated for dairy purposes are the Jersey, Guernsey, Holstein-Friesian, Ayrshire, and Suffolk dun. For the purposes both of the dairy-farmer and of the grazier, the Hereford and a cross between a shorthorn and an Ayrshire are much fancied. The ox is used in many parts of the world as a beast of draft. The "wild ox," now surviving in only a few parks, as at Chillingham Park in Northumberland, and at Cadzow Forest in Lanarkshire, seems, whatever its origin, to have been formerly an inhabitant of many forest-districts in Great Britain, particularly in the north of England and the south of Scotland.

An element discovered by Priestley in 1774, who called it *dephlogisticated air*. It was finally called *oxygen* by Lavoisier, because supposed to be present in all acids. Further investigation, however, has proved that this is not the case. Oxygen is a chemical element existing as a permanent gas, colorless, odorless, and tasteless, and somewhat heavier than atmospheric air. It is soluble in water, which at a temperature of 60° F. dissolves $\frac{3}{100}$ of its volume of oxygen. Oxygen combines very readily with most of the elements, and forms oxids with all of them excepting fluorin. The act of combination is so energetic in many cases as to evolve light and heat, the phenomena of combustion. In other cases, as in the tarnishing or rusting of metals and the decay of animal or vegetable substances, oxidation takes place so slowly that, while the result is the same, the heat evolved at one time is not enough to produce luminous effects or even to be sensible. Free or uncombined oxygen is essential to all animal and vegetable life. Animal heat and muscular energy are results of a slow combustion produced in all parts of the system by oxygen carried in the blood from the lungs. In sunlight oxygen is exhaled by growing plants, but a certain quantity is assimilated and is essential to life. Oxygen is the most widely distributed and abundant element in nature; it constitutes about one fifth of the total volume of the atmosphere, which is a mechanical mixture of oxygen and nitrogen with small amounts of other substances. Water contains about 89 per cent. of it by weight, and it is found in most animal and vegetable products, acids, oxids, and salts. The rocks which make up most of the earth's crust contain between 40 and 50 per cent. of oxygen. Under certain conditions oxygen may be made to pass into an allotropic or condensed form called *ozone*.

It was Lavoisier who gave to this curious kind of air or gas the name of *Oxygen*, by which it is now universally known; and it was he, too, who first showed, by the most conclusive experiments, what was really the composition of atmospheric air. His determination of the constitution of the air was made in the year 1777.

Pg. *ostra* = It. *ostrea*, now *ostrica* = AS. *ōstre* = D. *oester* (> G. *üster*, now *auster*) = Icel. Sw. *ostra* = Dan. *östers*, < L. *ostrea*, f., rarely *ostreum*, neut., < Gr. ὄστρεον, an oyster, named from its hard shell (cf. ὄστρακον, a shell, potsherd, earthen vessel: see *ostracize*, etc.), akin to ὀστέον, a bone, shell, L. *os* (*oss-*), a bone: see *os*$^1$.] 1. An edible bivalve mollusk of the family *Ostreidæ*, such as *Ostrea edulis*, the common species of Europe, and *O. virginica*, that of the Atlantic coast of the United States. The species are very numerous, and are found in all temperate and tropical countries, in salt and brackish water; there are also many fossil species. The shell is very irregular, both inequivalve and inequilateral, with one valve flattened and the other more concavo-convex, both rough outside and nacreous inside. Each valve has one purplish eye or spot, showing where the single adductorial muscle is attached, oysters being thus monomyarian. The gristly button-shaped body in the flesh is this ligament. The soft greenish substance corresponds to a liver. The fluted layers around a part of the body are the gills or breathing-organs. Oysters have sex, and are very prolific. They spawn in north temperate countries in May and June, during which period and for some time afterward they are not so good for food; whence the common saying that oysters are not eatable in those months which have no *r* in their names. The spawn or fry is called *spat* or *spet*. Oysters are now very extensively cultivated, the resulting stock being superior to the natural oyster. Starfishes and some carnivorous gastropods (see *borer*) are among the great obstacles to success with which oyster-culture has to contend. Oysters feed upon a great many different aquatic organisms of minute size. In confinement they eat corn-meal greedily. See cuts under *ciborium*, *integropalliate*, and *Ostrea*.

**ozone** (ō′zōn), *n.* [= F. *ozone*; < Gr. *ὄζειν*, smell, + *-one.*] A modification of oxygen, having increased chemical activity; a colorless gas having a peculiar odor like that of air which contains a trace of chlorin. The density of ozone is one and one half times that of oxygen. It is produced when the electric spark is passed through air or oxygen, when a stick of phosphorus is allowed to oxidize slowly, and in various other ways. At a high temperature ozone is changed into ordinary oxygen, two volumes of the former yielding three volumes of the latter. Chemical tests show that ozone exists in the atmosphere to a minute extent, and in greater quantity in country districts than in towns, while in crowded thoroughfares it ceases to be recognizable. Ozone has a great power of destroying offensive odors, and is a powerful bleacher and an intense oxidizer.

> *Roscoe and Schorlemmer*, Chemistry, I. 200.

> *Ozonometers* have been variously constructed and tried, but no clear and consistent results have yet been obtained by ordinary observers, so much individual tact is essential to dealing satisfactorily with the test papers and their alterations.
> *Fitz Roy*, Weather Book, p. 29.

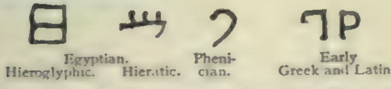
When properly exposed, the degree of discoloration indicates the relative amount of ozone in the air. Ozone-papers are usually either red litmus-paper dipped in a dilute solution of potassium iodide, or paper saturated with a mixture of potassium iodide and starch. In the litmus-paper the ozone decomposes the potassium iodide and combines with the potassium, forming potash, by which the red litmus is rendered blue. In the iodized starch-papers, the ozone combines with the potassium, and the free iodine combines with the starch, forming a blue iodide of starch.

**ozonoscopic** (ō-zō-nọ-skop′ik), *a.* [< *ozonoscope* + *-ic.*] Indicating the presence of ozone.

**P** 1. The sixteenth letter and twelfth consonant of the English alphabet, having a corresponding position in other alphabets. The scheme of parallel forms, as given in the case of the other letters (see especially *A*), is as follows:



The usual Greek Π was made by extending the originally short second perpendicular limb; the Latin (whence our) *P*, by curving the same around to meet the perpendicular (see *R*). *P* in all these alphabets stands for the same unvarying sound: namely, for the surd labial mute (corresponding to *b* as sonant, and *m* as nasal), made with closure of the lips, during the maintenance of which closure there is complete silence, its character being brought to light by explosion upon the following sound. The *p*-sound is in English much less common (below a third) than the *t*-sound, and slightly less common (about four fifths) than the *k*-sound. The character *p* has no varieties or irregularities of pronunciation in English save as it is silent at the beginning of a few Greek words, as *psalm*, *pneumatic*, *pteropod*, and, much more rarely, elsewhere, as in *receipt*, *accompt*. It enters into one important digraph, namely *ph*, found in numerous words of classical origin, and pronounced as *f* (but originally as written, or as an aspirated *p*, a *p* with an audible *h* after it, as in our compound *uphill*). (See *ph*.) According to the general law of correspondence, a *p* in the Germanic part of our language should represent an original *b*; but *b* appears to have been almost altogether wanting in the primitive language of our family; and hence our *p*, when not of classical origin, or borrowed from elsewhere, is the result of some irregular process.

2. As a medieval numeral, 400; with a dash over it ($\bar{\mathrm{P}}$), 400,000.—3. As a symbol: (*a*) In *chem.*, the symbol for *phosphorus*. (*b*) In *math.*, the Greek capital Π denotes a continued product.

Thus, $\overset{m}{\underset{1}{\Pi}}{}_{\rho}(1 + \rho)$, for which $\Pi(1 + m)$ is also written, denotes the product $(1 + m)\,m\,(m - 1) \ldots 3.2.1$. The small Greek letter π denotes the ratio of the circumference to the diameter, or 3.14159265359 +. This notation was introduced by Euler. The other form of the Greek minuscule, ϖ, denotes in astronomy the longitude of the perihelion.

(*b*) Tubes of lead or other soft metal filled with some vegetable material, such as hemp or cotton. The ends of the tubes are either forced or soldered together.—**Oil-well packing**, a packing inserted between the pipe and the interior surface of the boring in an oil-well to keep surface-water, or water from the sides of the hole, from running into the well, and to prevent oil in some wells from being forced out around the pipe by a pressure of gas. The packing originally used was a leather bag filled with flaxseed, called a *seed bag*, made in the form of a ring. The flaxseed, swelling on being wetted, closed tightly the opening to be stopped. This packing swelled so tightly as to be very difficult to remove—a difficulty which led to the invention of many substitutes. One of these is the modern water-packing, which consists of an annular leather packing, concave on the upper surface, surrounding the pipe, and held in position by a screw-joint. The weight of the superincumbent water presses this packing closely against the interior of the bore. Another form of oil-well packing, which stops efflux of oil under internal gas-pressure, as well as influx of surface-water, is shown in the accompanying cut.

> *Dawson*, Geol. Hist. of Plants, p. 38.

**Palæopteris** (pā-lẹ̄-op′tẹ-ris), *n.* [NL., < Gr. *παλαιός*, ancient, + *πτερίς*, a fern.] A genus of fossil ferns, established by Schimper (1869). The ferns included in this genus differ from the living *Adiantum* in some details of fructification, and under the name of *Palæopteris* are included species previously referred by authors to the genera *Cyclopteris*, *Sphenopteris*, *Nœggerathia*, and others. One species was named by Linnæus *P. alexandri*, on the supposition that it was that mentioned by Onesicritus, a historian of Alexander the Great. These birds are known as *ring-parrots*, from the characteristic collar around the neck. *P. torquatus* is the common ring-parrot of India, in parts of which country it abounds, sometimes in flocks of thousands. This appears to be the bird often figured as an attribute or accessory of some of the Hindu goddesses in sculpture and painting, like the owl of Minerva or the dove of Venus. *Palæornis* is the largest as well as the name-giving genus of its group, with upward of 20 species, inhabiting chiefly the Oriental regions, but also Africa. The general color is green, the bill waxy-red in the male, the lores feathered, the tail long and cuneate, the wings pointed, and the form rather lithe. The voice is very loud and harsh, but the birds may be taught to talk a little, and prove tractable in confinement. See cut under *ring-parrot*.

**Palamite** (pal'a-mīt), *n.* [< *Palam(as)* (see def.) + *-ite*.] One of the followers of Gregory Palamas, a monk of Mount Athos in the fourteenth century. Simeon, abbot of a monastery at Constantinople in the eleventh century, taught that by fasting, prayer, and contemplation, with concentration of thought on the navel, the heart and spirit would be seen within, luminous with a visible light. This light was believed to be uncreated and the same which was seen at Christ's transfiguration, and is known accordingly as the *Uncreated Light of Mount Tabor*. The doctrine was more carefully formulated and defended by Palamas, who taught that there exists a divine light, eternal and uncreated, which is not the substance or essence of deity, but God's activity or operation. The Palamites were favored by the emperor John Cantacuzene, and their doctrine was affirmed by a council at Constantinople in 1351. They were called by their opponents *Euchites* and *Massalians*. The palanquin proper is a sort of box about 8 feet long, 4 feet wide, and as much in height, with wooden shutters made on the principle of the Venetian blind. It used to be a very common conveyance in India, especially among the European residents, but the introduction of railways and the improvement of the roads have caused it to be almost wholly abandoned by Europeans. In Japan the palanquin is called *norimono*, and is suspended from a pole or beam passing over the top. A similar conveyance called a *kiaotsŭ* is extensively used in some parts of China; it is, however, furnished with long shafts before and behind instead of the pole, and is carried by mules. Also *palatial*.—**2.** Uttered by the aid of the palate, as certain sounds. See II., 2.—**Palatal glands, index.** Same as *palatine glands, index* (which see, under *palatine*$^2$).

**II.** *n.* **1.** A palatine bone or palate-bone proper, one of a pair, right and left, of facial bones entering into the formation of the hard palate. They exhibit the utmost diversity of shape and relative size, but preserve constant position and relation in the bony framework of the upper jaw, where they are interposed between the supramaxillary bones in front and the pterygoid bones behind, and thus form an integral part of the preoral visceral arch. In their simplest form, the palatals are mere rods or plates extending horizontally from the pterygoids to the maxillaries. Their connection with the latter is closest, most frequently by fixed suture or ankylosis; with the former it is usually freer, often by movable articulation. There are many modifications of these bones in the lower vertebrates, and in the higher the tendency is to shortening, widening, heightening, and complete fixation, with some connections not acquired in lower animals. Such modifications reach a climax in man, where the palatals have a singular shape somewhat like the letter L, and very extensive articulations with no fewer than five other bones—the sphenoid, ethmoid, supramaxillary, maxilloturbinal, vomer—and with each other. The bone here consists of a horizontal part, or palatal plate, which extends mesad and meets its fellow of the opposite side, thus forming the back part of the bony palate, and of a vertical plate which reaches into the orbit of the eye by a part called the *orbital process*. Each bone thus enters into the formation of the walls of three cavities, of the mouth, nose, and eye; it also assists to form three fossæ, the zygomatic, sphenomaxillary, and pterygoid; it bounds part of the sphenomaxillary fissure, and contributes to closure of the orifice of the antrum of Highmore. The bone furnishes attachment in man to the azygos uvulæ muscle, the tensor palati, the superior constrictor of the pharynx, and both internal and external pterygoid muscles. Notwithstanding its complexity of figure and relations, it is a simple or single bone, developed in membrane from one center of ossification. See cuts under *Anura*, *craniofacial*, *Crotalus*, *desmognathous*, *dromæognathous*, *Felidæ*, *palatoquadrate*, *Physeterinæ*, *Python*, and *sphenoid*.
**2.** A sound usually produced by the upper surface of the tongue against a part of the palate further forward than that at which our *k* and *g* are made; but sometimes used of any sound made between the tongue and any part of the hard or soft palate. Thus, the German *ch* of *ich* is called palatal, and that of *ach* guttural; the Sanskrit has palatal sounds distinguished from gutturals; our *i* and *e* and *y* are called palatal, as also the compound *ch* and *j*. The term is a loose one, and requires definition as used by any authority.

**palatalization** (pal"ā-tal-i-zā'shon), *n.* [< *palatalize* + *-ation*.] A making palatal; a conversion (especially of gutturals) into palatal sounds, as of *k* into *ch*, *g* into *j*, *s* into *sh*.

> The *palatalization* of the guttural does not necessitate the ι-coloring of the vowel. *Amer. Jour. Philol.*, VII. 238.

**palate** (pal'āt), *n.* [< ME. *palat*, *palet*, < OF. *palat*, **palet* (F. *palais*, arising from a confusion between *palais*, palace, and **palet*, **palé*, the vernacular OF. form) = It. *palato* (cf. Sp. Pg. *paladar*, < L. as if **palatare*), < L. *palatum*, rarely *palatus*, the palate, the roof of the mouth.] **1.** The roof of the mouth and floor of the nose; the parts, collectively considered, which separate the oral from the nasal cavity. Most of the palate has a bony basis, formed of the maxillary bones and palate-bones, or of special plates or processes of these bones, the extent of which represents the *bony* or *hard palate*. Behind this, and continuous therewith, in man and many other animals, is the *soft palate*, a musculomembranous fold or curtain hanging down between the back part of the buccal cavity and the upper part of the pharynx, technically called the *velum palati* or *veil of the palate*. The uvula hangs from the middle of the free edge of this velum, and its sides are continuous with the contracted walls of the passage, called the *pillars* or *arches of the palate*, and constituting the isthmus of the fauces. In osteology the term *palate* is of course restricted to the bony parts. In fishes the palate is that part of the roof of the mouth which corresponds to the palatal bones, behind the vomer and in front of the pharyngeals. See *palatal*, *n.*, 1, and cuts under *dromæognathous*, *mouth*, *nasal*, and *tonsil*.

About 1620 these were separated, the Upper Palatinate and the electoral vote passing to Bavaria, while a new electorate was created later for the Palatinate. In 1777 the two were reunited; in consequence of the treaties of Lunéville (1801) and of Paris (1814–15), Bavaria retained the Upper Palatinate and a portion of the Lower Palatinate west of the Rhine, while the remainder of the Lower Palatinate was divided among Baden, Hesse, Prussia, etc. The Bavarian portions now form the governmental districts of Palatinate and Upper Palatinate.

In birds the arch consists simply of the palate-bone, fixed in front and movably articulated behind with the pterygoid, which latter is also movably articulated with the quadrate. A similar arrangement characterizes reptiles; but in fishes this arch may be complicated by the addition of several different pterygoid bones, or in other ways. **Paleozoic, Palæozoic** (pā″lẹ̄-ọ̄-zō′ik), *a.* [= F. *paléozoïque*, < Gr. *παλαιός*, ancient, + *ζωή*, life.] In *geol.*, belonging to or constituting a geological formation characterized by the presence of ancient forms of life: applied to the oldest division of the geological series, beginning with the lowest stratified fossiliferous group, and extending upward to the base of the Triassic, or to the top of the Permian. The grand divisions of the Paleozoic are, proceeding upward or to groups later in age, the Silurian, Devonian, Carboniferous, and Permian. (See these words.) Of these the Permian is much the least important. The other divisions have been designated respectively as the "age of mollusks," the "age of fishes," and the "age of coal or of land-plants." The Paleozoic series may, from a paleontological point of view, be properly separated into two great divisions, a newer and an older. The former embraces the Silurian; the latter, the Devonian, Carboniferous, and Permian. The older Paleozoic is distinguished by the great predominance of graptolites, trilobites, and brachiopods, and by the absence of vertebrates; the newer Paleozoic, by the number and variety of the fishes and amphibia, by the disappearance of graptolites and trilobites, and by an extraordinarily developed flora, largely cryptogamic in character, from which a very considerable part of the coal of the globe has been formed. Rocks of Paleozoic age are spread over wide areas. They are especially important in the eastern and northeastern United States and in the Upper Mississippi valley, in which regions they usually form the surface-rock, being covered only with detrital formations of the most recent age. Almost the whole of the bed-rock in New York and Pennsylvania is of Paleozoic age, and here the various groups of this series were studied out by the Geological Surveys of those States from 1834 on. To the labors of Sedgwick and Murchison in Wales and western England, carried on at about the same time with the beginnings of the New York and Pennsylvania Surveys, is due the larger share of the credit of disentangling the complicated structure of a region where the Paleozoic rocks are extensively developed, and it is there that the materials were obtained for the establishment by Murchison of the Silurian and Devonian systems, which, with the Carboniferous and Permian, form the Paleozoic epoch.

**Palladian architecture**, a type of Italian architecture founded by Palladio upon his conception of the Roman antique as interpreted by Vitruvius, and upon the study of the Colosseum, baths, triumphal arches, and other secular buildings of the Romans. It has been applied more frequently to palaces and civic buildings than to churches. In the Palladian style the Roman orders are employed rather as a decorative feature than as a constructive element, and applied without regard to classic precedent.

3. Chemical symbol, Pd; atomic weight, 106.5. One of the rare metals associated with platinum. It was separated from native platinum by Wollaston in 1803, and named after the planet Pallas, which had just before that time been discovered by Olbers. Palladium is dimorphous. It occurs in Brazil native, in minute octahedral crystals; and on the Harz it has been found in small hexagonal plates. It is, however, a decidedly rare substance, and the chief supply comes from the working over of the platiniferous residues of various mints. It resembles platinum in appearance, but is harder; its specific gravity is 11.4. It fuses more readily than platinum or any other of the so-called platinum metals, melting, as is stated by some authorities, about as easily as wrought-iron. It is both ductile and malleable, and would be a very useful metal if it were not so scarce as to be expensive and irregularly attainable. The graduated surfaces of some astronomical instruments have been made of palladium, a use for which this metal is admirably adapted on account of its color and its unalterability in the air. Alloyed with silver, it has been employed by dentists as a substitute for gold.—**Palladium-gold.** See *porpezite*.

One of the planetoids revolving between the orbits of Mars and Jupiter: discovered (the second in the order of time) by Olbers, at Bremen, in 1802. On account of its minuteness, and the nebulous appearance by which it is surrounded, no certain conclusion can be arrived at respecting its magnitude. Its diameter has been estimated at 172 miles, and its period of revolution is 4.61 years. Its light undergoes considerable variation, and its motion in its orbit is greatly disturbed by the powerful attraction of Jupiter.

They both refer to the effort to make an offense seem less by bringing forward considerations tending to excuse; they never mean the effort to exonerate or exculpate completely. They have had earlier differences of meaning, and *palliate* has a peculiar meaning of its own (see def. 3); *palliate* also would be likely to be used of the more serious offense; but otherwise the words are now essentially the same.

It. *pallio*, < L. *pallium*, a coverlet, mantle, cloak; cf. *palla*, a mantle, cloak: see *pall*$^{1}$.] 1. In *Rom. antiq.*, a voluminous rectangular mantle for men, corresponding to the Greek himation (see *himation*), and considered at Rome, because worn by Greek savants, as the particular dress of philosophers; also, a toga or other outer garment; a curtain, etc., of rectangular shape.—2. *Eccles.*: (*a*) In the early church, a large mantle worn by Christian philosophers, ascetics, and monks. (*b*) A vestment worn by certain bishops, especially patriarchs and metropolitans. It seems to have come first into use in the Eastern Church, where it is known as the *omophorion*, and to have been worn by patriarchs, and given by them to metropolitans. Some authorities think that it was of primitive origin and at first worn by all bishops, while others hold that it was originally an imperial garment, bestowed by the emperor as a mark of distinction upon patriarchs and others, and afterward given to metropolitans and bishops generally. It has always been of wool, as indicating the pastoral office. It seems at first to have been a mantle rolled together and passed round the neck so as to fall both in front and at the back. It then became contracted in width and was worn nearly as it still is in the Greek Church, as a wide woolen band fastened round the shoulders and descending nearly to the feet. In the Latin or Roman Catholic Church it gradually assumed a different shape, and is now a narrow band like a ring, passing round the shoulders, with two short vertical pieces, falling respectively down the breast and the back. It is ornamented with crosses, and has three golden pins by which it is attached with loops to the chasuble. The pallium was worn anciently in the Western Church by the Pope and by Gallican metropolitans. From the sixth century it began to be given by the Pope to some metropolitans outside of his own diocese, in sign of special favor or distinction—at first, according to some authorities, only with approval of the emperor. By the seventh or eighth century it came to be regarded as a sign of acknowledgment of papal supremacy. At present, in the Roman Catholic Church, a bishop elected or translated to a see of metropolitical or higher rank must beg the Pope for the pallium, and receives it after taking an oath of allegiance to the Pope. The Pope wears it whenever he officiates, bishops only on certain great feasts. Anglican archbishops no longer wear the pallium since the Reformation, but it forms part of the heraldic insignia of the archbishops of Canterbury, Armagh, and Dublin. Also called *pall*. (*c*) An altar-cloth; a frontal or pall.—3. In *conch.*, the mantle, mantle-flap, or mantle-skirt of a mollusk, an outgrowth of the dorsal body-wall. It is a specialized, more or less highly and very variously developed integument, including epithelial, vascular, glandular, and muscular structures, and forming folds or processes which represent the foot and other parts. It is often wanting. See cuts under *Lamellibranchiata*, *Pulmonata*, and *Tridacnidæ*. 4. In *ornith.*, the mantle; the stragulum; the back and folded wings together, in any way distinguished, as by color in a gull, etc.—5. A cirro-stratus cloud when it forms a uniform sheet over the whole sky.

M. Poëy has proposed the name of *Pallium*, but this term has not met with general acceptance.

**pall-mall** (pel-mel′), *n.* [Formerly also *palemaile*, *pallmaill*, *pallemaille*, *paillemail;* also, in more recent spelling, *pell-mell;* < OF. *palmail*, *palmaille*, *pallemaille*, *palemaille*, *paillemail*, *paillemaille*, etc., = Sp. *palamallo* = Pg. *palamalha*, < It. *palamaglio*, *pallamaglio*, the game of pall-mall, lit. 'ball-mallet,' < *palla*, ball (< ML. *palla*, ball, < OHG. *pallā*, MHG. G. *ball*: see *ball*$^{1}$), + *maglio*, < L. *malleus*, a mall, mallet: see *mall*$^{1}$.] 1. A game, formerly played, in which a ball of boxwood was struck with a mallet or club, the object being to drive it through a raised ring of iron at the end of an alley. The player who accomplished this with fewest strokes, or within a number agreed on, was the winner.

To St. James's Park, where I saw the Duke of York playing *pelemele*, the first time that ever I saw the sport.
*Pepys*, Diary, April 2, 1661.

The game might develop into golf or *pell mell*. . . . If the point played to was a hole in the ground, golf arose; if you played to a stone, tree, or rock, or through an iron hoop elevated on a post, *pell mell*, jeu de mail, Pila Malleus was the result. . . . Lauthier describes the attitude and "swing" at *pell mell* in words that apply equally well to golf. . . . Generally speaking, the aim was to "loft" the ball, in fewer strokes than your adversary took, through an elevated iron ring.

The flat of the hand; that part of the hand which extends from the wrist to the bases of the thumb and fingers on the side opposite the knuckles; more generally and technically, the palmar surface of the manus of any animal, as the sole of the fore foot of a clawed quadruped, as the cat or mouse, corresponding to the planta of the pes or foot. In man the palm is fleshy, and presents two special eminences, the *thenar* (ball of the thumb) and, opposite to it, the *hypothenar*, mainly due to the bulk of the subjacent muscles. The habitual tendency of the fingers in grasping and holding throws the skin into numerous creases, several principal ones being quite constant in position. The character of these creases, in all their detail and variation in different individuals, is the chief basis of chirognomy or palmistry. See phrases under *line*$^{2}$.

It. *palma*, < L. *palma*, a palm-tree, palm-branch, the topmost branch, any branch, a palm-branch as a symbol of victory, also the fruit of the palm, a date, also the name of several other plants; so called from the resemblance of the leaves of the palm-tree to the outspread hand; < *palma*, the palm of the hand: see *palm*¹. The Gr. name of the date-palm was φοῖνιξ: see *phenix*.] **1.** A tree or shrub of the order *Palmæ*. The palms form a natural plant-group of great interest, in appearance highly picturesque and often elegant, and in usefulness surpassed by no family except the grasses. The pulpy fruit of some species, most notably of the date, and the seed-kernel of others, preëminently the cocoanut, are edible. Oil is yielded by the fruit-pulp of some (oil-palm) and by the seeds of others (cocoanut, bacaba, etc.). The pith of the sago-palms is farinaceous, and the large terminal bud of the cabbage palm serves as a vegetable, as do the young seedlings of the palmyra. The sap of the wild date-tree and other species yields palm-sugar or jaggery; that of the coquito, palm-honey. The juice of various species becomes toddy or palm-wine, which in fermenting serves as yeast, and distilled affords a spirituous liquor. Aside from food and drink, the betel-nut, a kind of catechu, and a kind of dragon's-blood are palm-products; a candle-wax exudes from *Ceroxylon*; vegetable ivory is the nut of the ivory-palm. Palm-wood is useful for building (date-palm, palmyra, etc.), for fine work (porcupine-wood), for piles (palmetto), and for flexible articles (ratan). The leaves of many species serve for thatching (bussu-palm, royal palmetto, palmyra, etc.), for making hats, baskets, and fans, and in place of paper (palmetto, talipot, etc.). The leafstalks of some (kittul, piassava) furnish an important fiber, as also does the husk of the cocoanut. There are many other uses. The cocoanut-, date-, and palmyra-palms lead in importance. The palm of the Bible is the date-palm. (For symbolic use, see def. 2.) As ornamental plants in temperate regions the palms are indispensable where sufficient hothouse room can be had.

**2.** A branch, properly a leaf, of the palm-tree, anciently borne or worn as a symbol of victory or triumph; hence, superiority; victory; triumph; honor; prize. The palm was adopted as an emblem of victory, it is said, because the tree is so elastic as, when pressed, to rise and recover its correct position. The Jews carried palm-branches on festal occasions, and the Roman Catholic and Greek churches have preserved this usage in celebrating the entry of Christ into Jerusalem. See *Palm Sunday*. See also def. 3.

Among plants so designated are, in Great Britain, chiefly the great sallow or goat-willow, *Salix Caprea*, at the time when its catkins are out, and the common yew (the latter is universally so called in Ireland); in Europe also the olive, holly, box, and another willow; and in the northern United States the hemlock-spruce.

About 1,100 species are known, classed in 129 genera, 7 tribes, and 18 subtribes. They are mainly tropical, especially American, and are most abundant on coasts and islands; fewer in Asia and Australia; fewest in Africa; reaching lat. 44° N. in Europe, 36° in America, 34° in Asia. The species are usually local, excepting the cocoanut and four or five others. They are trees or shrubs, mostly unbranched, generally perennial, and continued only by a terminal and sometimes edible bud. Their large leaves are pinnately or radiately parallel-veined, undivided and plaited in the bud, divided slightly or completely on expansion. The flowers are small, regular, often rigid or fleshy, often diœcious, usually with six stamens, borne on a branching spadix, with several or many sheathing bract-like or woody spathes. The fruit is a berry or drupe or dry fruit, the outside commonly fibrous, within membranous, crustaceous, woody, or stony. (Lyngbye, 1819), a dim. form, having reference to the jelly-like appearance; < Gr. παλμός, vibration, < πάλλειν, shake, vibrate.] A genus of fresh-water algæ, typical of the *Palmellaceæ*, having globose or oblong cells, with chlorophyl usually green, but sometimes changing to orange or reddish color. The cells are surrounded with a thick integument, which is generally soon confluent into a shapeless mass of jelly; multiplication is mostly by division. The forms included in this genus are probably not autonomous, but represent arrested polymorphous forms which multiply rapidly by the process of cell-multiplication, without developing, for a protracted period, the true plant. The particular plants, however, to which they belong have never been determined.—**Palmella stage**, or **palmella condition**, a general phrase sometimes applied to certain of the lower algæ which exhibit the peculiar gelatinous masses described above. In the *Schizomycetes* this condition or stage has lately been called the *zoöglœa stage*. See *Zoöglœa*.

**Palmellaceæ** (pal-me-lā′sẹ̄-ē), *n. pl.* [NL., < *Palmella* + *-aceæ.*] A so-called order of fresh-water algæ, taking its name from the genus *Palmella*, including forms of doubtful autonomy. They are strictly unicellular, with the cells either single or numerous, constituting families, and embedded in an amorphous stratum of jelly. Reproduction is mainly by fission. Also *Palmelleæ*.

A pilgrim who had returned from the Holy Land, had fulfilled his vow, and had brought with him a palm-branch to be deposited on the altar of his parish church; hence, an itinerant monk who went from shrine to shrine, under a perpetual vow of poverty and celibacy. The distinction between *pilgrim* and *palmer* seems never to have been closely observed.

**palmerin** (pal′mėr-in), *n.* [< *Palmerin* (see def.).] One of a line of romantic heroes of the age of chivalry, who took their names or their titles from Palmerin de Oliva, an illegitimate grandson of a Greek emperor of Constantinople. This Palmerin derived his name from the circumstance of his exposure in a wicker basket on a mountain-side among palms and olive-trees in Spain. He afterward became famous for his exploits in Germany, England, and the Orient. The exploits of the Palmerins, as celebrated in the famous Spanish romances called by their name, are evidently modeled after those of Amadis of Gaul. In literature the name is often applied as a term of distinction to any redoubtable champion of the age of chivalry.

> That brave Rosicler
> That damned brood of ugly giants slew,
> And *Palmerin* Frannarco overthrew.
> *Beau. and Fl.*, Knight of Burning Pestle, iii. 2.

> The oldest ballads tell us nothing at all . . . of the *Palmerins*, nor of many other well-known and famous heroes of the shadow-land of chivalry.
> *Ticknor*, Span. Lit., I. 119.

**palmer-worm** (pä′mėr-wėrm), *n.* [< *palmer*$^2$ + *worm.*] 1. A caterpillar; especially, a hairy caterpillar injurious to vegetation, but what kind is unknown or undetermined. The name occurs three times in the Bible (Joel i. 4; ii. 25; Amos iv. 9) as the translation of the Hebrew *gāzām*, rendered in the Septuagint κάμπη and in the Vulgate *eruca*. Some have supposed it to be a destructive kind of locust, as *Pachytylus migratorius;* but in Joel the name is expressly distinguished from "locust." The Hebrew name is referred to a root meaning 'to cut off'; the Greek κάμπη refers to the bending or looping of some caterpillars, apparently pointing to a looper or measuring-worm—that is, the larva of some geometrid moth; and the Latin *eruca* may have the same significance. The destructiveness of many of these geometrids would fully bear out the Biblical implication. See *oubit*.

> There is another sort of these Catterpillers, who haue no certaine place of abode, nor yet cannot tell where to find theyr foode, but, like vnto superstitious Pilgrims, doo wander and stray hither and thither, (and like Mise) consume and eate vp that which is none of their owne; and these haue purchased a very apt name amongst vs Englishmen, to be called *Palmer-worms*, by reason of their wandering and rogish life (for they neuer stay in one place, but are euer wandering), although by reason of their roughnes and ruggednes some call them Beare-wormes. They can by no means endure to be dyeted, and to feede vpon some certaine herbes and flowers, but boldly and disorderly creepe ouer all, and tast of all plants and trees indifferently, and liue as they list.
> *Topsell*, History of Serpents (1608), p. 105.

> That which the *palmerworm* hath left hath the locust eaten. Joel i. 4.

2. In the United States, the larva of the tineid moth *Ypsilophus pometella*, which in eastern parts of the country appears on the leaves of the apple in June, draws them together, and skeletonizes them.

It forms part of the device in the seal and flag of South Carolina, the Palmetto State. Its wood is not attacked by the teredo and is very durable under water, and is therefore much used for piles and wharves. The fibrous leaves of this and the dwarf palmetto, *S. Adansoni*, are made into hats, baskets, and fans, and also furnish an upholstering material. The palmetto, or hemp-palm, of southern Europe and North Africa, is *Chamærops humilis*, a dwarf species, affording abundant fiber, consumed chiefly as "vegetable horsehair." The labial palpi are two in number, rising either from the ligula or from the edge of the mentum, the maxillary palpi are placed one on the outer side of each maxilla. Besides these, certain *Coleoptera* have a second two-jointed palpiform appendage on each maxilla, formed by a modification of the galea or external lobe. The palpi vary much in form and in the number of joints, which is never more than six; they are sometimes aborted or entirely absent, as in the *Hemiptera*. In the *Lepidoptera* this term is commonly restricted to the large labial palpi, the much smaller maxillary ones being distinguished as *palpuli*. The palpi are supposed by some to be organs of taste or touch. In the spiders the maxillary palpi are greatly developed, forming the pedipalps; these, in the scorpions, become chelate appendages, commonly called the front legs. Small palpi are also developed from the mandibles and maxillæ of certain crustaceans.
